

Package: CGR (via r-universe)

August 27, 2024

Type Package

Title Compound Growth Rate for Capturing the Growth Rate Over the Period

Version 0.1.0

Author Dr. S. Vishnu Shankar [aut, cre], Dr. Ranjit Kumar Paul [aut],
Dr. Himadri Shekhar Roy [aut], Dr. Md Yeasin [aut]

Maintainer Dr. S. Vishnu Shankar <S.vishnushankar55@gmail.com>

Description The compound growth rate indicates the percentage change of a specific variable over a defined period. It is calculated using non-linear models, particularly the exponential model. To estimate the compound growth rates, the growth model is first converted to semilog form and then analyzed using Ordinary Least Squares (OLS) regression. This package has been developed using concept of Shankar et al. (2022)<[doi:10.3389/fsufs.2023.1208898](https://doi.org/10.3389/fsufs.2023.1208898)>.

CGR

Description

Compound Growth Rate for Capturing the Growth Rate Over the Period

Usage

```
CGR(variable, data, verbose = FALSE)
```

Arguments

variable	Time series data taken for the study
data	Name of the data taken for the study
verbose	Logical. If TRUE, the function prints detailed information about its progress. Default is FALSE.

Value

Returns a list containing the Compound growth rate for capturing the growth rate over the period and other model parameters. The list includes:

- CGR: Growth rate calculated for the data.
- AoS: The value derived by taking anti log of the slope of exponential model.

Examples

```
{
  library(CGR)
  years <- 1:50
  value<-rnorm(length(years),100, 50)
  data <- data.frame(Year = years, Sales = round(value))
  CGR_results <- CGR(variable = data$Sales, data = data)
  print(CGR_results)
}
```
