# Package: FinancialMath (via r-universe)

November 6, 2024

Type Package

Title Financial Mathematics for Actuaries

Version 0.1.1

Author Kameron Penn [aut, cre], Jack Schmidt [aut]

Maintainer Kameron Penn <kameron.penn.financialmath@gmail.com>

Description Contains financial math functions and introductory derivative functions included in the Society of Actuaries and Casualty Actuarial Society 'Financial Mathematics' exam, and some topics in the 'Models for Financial Economics' exam.

# **Contents**

<span id="page-1-0"></span>

<span id="page-1-1"></span>amort.period *Amortization Period*

# Description

Solves for either the number of payments, the payment amount, or the amount of a loan. The payment amount, interest paid, principal paid, and balance of the loan are given for a specified period.

# Usage

amort.period(Loan=NA,n=NA,pmt=NA,i,ic=1,pf=1,t=1)

<span id="page-2-0"></span>

#### Details

Effective Rate of Interest:  $eff.i = (1 + \frac{i}{ic})^{ic} - 1$  $j = (1 + e f f.i)^{\frac{1}{pf}} - 1$  $Loan = pmt * a_{\overline{n}|j}$ Balance at the end of period t:  $B_t = pmt * a_{\overline{n-t}|j}$ Interest paid at the end of period t:  $i_t = B_{t-1} * j$ Principal paid at the end of period t:  $p_t = pmt - i_t$ 

#### Value

Returns a matrix of input variables, calculated unknown variables, and amortization figures for the given period.

#### Note

Assumes that payments are made at the end of each period.

One of n, pmt, or Loan must be NA (unknown).

If pmt is less than the amount of interest accumulated in the first period, then the function will stop because the loan will never be paid off due to the payments being too small.

If the pmt is greater than the loan amount plus interest accumulated in the first period, then the function will stop because one payment will pay off the loan.

t cannot be greater than n.

#### Author(s)

Kameron Penn and Jack Schmidt

#### See Also

[amort.table](#page-3-1)

#### Examples

```
amort.period(Loan=100,n=5,i=.01,t=3)
```

```
amort.period(n=5,pmt=30,i=.01,t=3,pf=12)
```
amort.period(Loan=100,pmt=24,ic=1,i=.01,t=3)

<span id="page-3-1"></span><span id="page-3-0"></span>

#### Description

Produces an amortization table for paying off a loan while also solving for either the number of payments, loan amount, or the payment amount. In the amortization table the payment amount, interest paid, principal paid, and balance of the loan are given for each period. If n ends up not being a whole number, outputs for the balloon payment, drop payment and last regular payment are provided. The total interest paid, and total amount paid is also given. It can also plot the percentage of each payment toward interest vs. period.

#### Usage

```
amort.table(Loan=NA,n=NA,pmt=NA,i,ic=1,pf=1,plot=FALSE)
```
#### Arguments

#### Details

Effective Rate of Interest:  $eff.i = (1 + \frac{i}{ic})^{ic} - 1$  $j = (1 + e f f.i)^{\frac{1}{pf}} - 1$  $Loan = pmt * a_{\overline{n}|j}$ Balance at the end of period t:  $B_t = pmt * a_{\overline{n-t}|j}$ Interest paid at the end of period t:  $i_t = B_{t-1} * j$ Principal paid at the end of period t:  $p_t = pmt - i_t$ Total Paid=  $pm* n$ Total Interest Paid=  $pm* n - Loan$ If  $n = n^* + k$  where  $n^*$  is an integer and  $0 < k < 1$ : Last regular payment (at period  $n^*$ ) = pmt  $* s_{\overline{k}|j}$ Drop payment (at period  $n^* + 1$ ) =  $Loan * (1 + j)^{n^* + 1} - pmt * s \frac{n^*}{n^*}$ Balloon payment (at period  $n^*$ ) =  $Loan * (1+j)^{n^*} - pmt * s \frac{n^*}{n^*} + pmt$ 

# <span id="page-4-0"></span>annuity.arith 5

#### Value

A list of two components.

#### Note

Assumes that payments are made at the end of each period.

One of n, Loan, or pmt must be NA (unknown).

If pmt is less than the amount of interest accumulated in the first period, then the function will stop because the loan will never be paid off due to the payments being too small.

If pmt is greater than the loan amount plus interest accumulated in the first period, then the function will stop because one payment will pay off the loan.

#### Examples

```
amort.table(Loan=1000,n=2,i=.005,ic=1,pf=1)
```
amort.table(Loan=100,pmt=40,i=.02,ic=2,pf=2,plot=FALSE)

```
amort.table(Loan=NA,pmt=102.77,n=10,i=.005,plot=TRUE)
```
<span id="page-4-1"></span>annuity.arith *Arithmetic Annuity*

#### Description

Solves for the present value, future value, number of payments/periods, amount of the first payment, the payment increment amount per period, and/or the interest rate for an arithmetically growing annuity. It can also plot a time diagram of the payments.

#### Usage

```
annuity.arith(pv=NA,fv=NA,n=NA,p=NA,q=NA,i=NA,ic=1,pf=1,imm=TRUE,plot=FALSE)
```
<span id="page-5-0"></span>6 annuity.arith

#### Arguments

#### Details

Effective Rate of Interest:  $eff.i = (1 + \frac{i}{ic})^{ic} - 1$ 

 $j = (1 + e f f.i)^{\frac{1}{pf}} - 1$  $fv = pv * (1 + j)^n$ Annuity Immediate:  $pv = p * a_{\overline{n}|j} + q * \frac{a_{\overline{n}|j} - n*(1+j)^{-n}}{i}$ .j Annuity Due:  $pv = (p * a_{\overline{n}|j} + q * \frac{a_{\overline{n}|j} - n*(1+j)^{-n}}{i})$  $\frac{\binom{*(1+j))}{j}}{j}$  \*  $(1+i)$ 

#### Value

Returns a matrix of the input variables, and calculated unknown variables.

#### Note

At least one of pv, fv, n, p, q, or i must be NA (unknown). pv and fv cannot both be specified, at least one must be NA (unknown).

#### Author(s)

```
<span id="page-6-1"></span>annuity.geo *Geometric Annuity*

#### Description

Solves for the present value, future value, number of payments/periods, amount of the first payment, the payment growth rate, and/or the interest rate for a geometrically growing annuity. It can also plot a time diagram of the payments.

# Usage

annuity.geo(pv=NA,fv=NA,n=NA,p=NA,k=NA,i=NA,ic=1,pf=1,imm=TRUE,plot=FALSE)

# Arguments

#### Details

Effective Rate of Interest:  $eff.i = (1 + \frac{i}{ic})^{ic} - 1$ 

$$
j = (1 + eff.i)^{\frac{1}{pf}} - 1
$$
  
\n
$$
fv = pv * (1 + j)^n
$$
  
\nAnnuity Immediate:  
\n
$$
j \geq k: pv = p * \frac{1 - (\frac{1+k}{1+j})^n}{j-k}
$$
  
\n
$$
j = k: pv = p * \frac{n}{1+j}
$$
  
\nAnnuity Due:

j != k: 
$$
pv = p * \frac{1 - (\frac{1+k}{1+j})^n}{j-k} * (1+j)
$$
  
j = k:  $pv = p * n$ 

# <span id="page-7-0"></span>Value

Returns a matrix of the input variables and calculated unknown variables.

#### Note

At least one of pv, fv, n, pmt, k, or i must be NA (unknown).

pv and fv cannot both be specified, at least one must be NA (unknown).

annuity.level(pv=80,fv=NA,n=15,pf=2,pmt=NA,i=.01,imm=FALSE)

<span id="page-8-1"></span>bear.call *Bear Call Spread*

#### Description

Gives a table and graphical representation of the payoff and profit of a bear call spread for a range of future stock prices.

#### Usage

```
bear.call(S,K1,K2,r,t,price1,price2,plot=FALSE)
```
<span id="page-9-0"></span>10 bear.call

# Arguments

# Details

Stock price at time  $t = S_t$ For  $S_t \le K1$ : payoff = 0 For  $K1 < S_t < K2$ : payoff =  $K1 - S_t$ For  $S_t$  >= K2: payoff = K1 – K2  $payoff = profit + (price1 - price2)*e^{r*t}$ 

# Value

A list of two components.

# Note

K1 must be less than S, and K2 must be greater than S.

bear.call.bls(S=100,K1=70,K2=130,r=.03,t=1,sd=.2)

<span id="page-11-1"></span>

#### bls.order1 *Black Scholes First-order Greeks*

# Description

Gives the price and first order greeks for call and put options in the Black Scholes equation.

# Usage

bls.order1(S,K,r,t,sd,D=0)

# Arguments

### Value

A matrix of the calculated greeks and prices for call and put options.

# Note

Cannot have any inputs as vectors.

t cannot be negative.

Either both or neither of S and K must be negative.

# Author(s)

Kameron Penn and Jack Schmidt

<span id="page-11-0"></span>

#### <span id="page-12-0"></span>bond 13

# See Also

[option.put](#page-30-1) [option.call](#page-29-1)

# Examples

```
x <- bls.order1(S=100, K=110, r=.05, t=1, sd=.1, D=0)
ThetaPut <- x["Theta","Put"]
DeltaCall <- x[2,1]
```
bond *Bond Analysis*

# Description

Solves for the price, premium/discount, and Durations and Convexities (in terms of periods). At a specified period (t), it solves for the full and clean prices, and the write up/down amount. Also has the option to plot the convexity of the bond.

#### Usage

bond(f,r,c,n,i,ic=1,cf=1,t=NA,plot=FALSE)

#### Arguments

# Details

Effective Rate of Interest:  $eff.i = (1 + \frac{i}{ic})^{ic} - 1$ 

 $j = (1 + e f f.i)^{\frac{1}{cf}} - 1$ coupon =  $\frac{f*r}{cf}$  (per period) price = coupon\* $a_{\overline{n}|j} + c * (1+j)^{-n}$ 

$$
MACD = \frac{\sum_{k=1}^{n} k*(1+j)^{-k} * coupon + n*(1+j)^{-n} * c}{price}
$$
  
\n
$$
MODD = \frac{\sum_{k=1}^{n} k*(1+j)^{-(k+1)} * coupon + n*(1+j)^{-(n+1)} * c}{price}
$$
  
\n
$$
MACC = \frac{\sum_{k=1}^{n} k^{2}*(1+j)^{-k} * coupon + n^{2}*(1+j)^{-n} * c}{price}
$$
  
\n
$$
MODC = \frac{\sum_{k=1}^{n} k*(k+1)*(1+j)^{-(k+2)} * coupon + n*(n+1)*(1+j)^{-(n+2)} * c}{price}
$$

# Price (for period t):

If t is an integer: price =coupon\* $a \frac{n-t}{n-t}$  +  $c*(1+j)^{-(n-t)}$ 

If t is not an integer then  $t = t^* + k$  where  $t^*$  is an integer and  $0 < k < 1$ :

full price = ( coupon \* 
$$
a \frac{n-t^*}{n-t^*}
$$
) +  $c * (1 + j)^{-(n-t^*)}$ ) \*  $(1 + j)^k$ 

clean price = full price−k∗coupon

# If price  $> c$ :

 $premium = price - c$ 

Write-down amount (for period t) =  $(\text{coupon} - c * j) * (1 + j)^{-(n-t+1)}$ 

# If price  $<$  c :

 $discount = c-price$ 

Write-up amount (for period t) =  $(c * j$  – coupon)  $*(1 + j)^{-(n-t+1)}$ 

# Value

A matrix of all of the bond details and calculated variables.

#### Note

t must be less than n.

To make the duration in terms of years, divide it by cf.

To make the convexity in terms of years, divide it by  $cf^2$ .

# Examples

bond(f=100,r=.04,c=100,n=20,i=.04,ic=1,cf=1,t=1)

bond(f=100,r=.05,c=110,n=10,i=.06,ic=1,cf=2,t=5)

<span id="page-14-1"></span><span id="page-14-0"></span>

# Description

Gives a table and graphical representation of the payoff and profit of a bull call spread for a range of future stock prices.

# Usage

bull.call(S,K1,K2,r,t,price1,price2,plot=FALSE)

# Arguments

# Details

Stock price at time  $t = S_t$ For  $S_t \le K1$ : payoff = 0 For  $K1 < S_t < K2$ : payoff =  $S_t - K1$ For  $S_t \geq K2$ : payoff =  $K2 - K1$  $\text{profit} = \text{payoff} + (\text{price2} - \text{price1}) * e^{r * t}$ 

# Value

A list of two components.

#### Note

K1 must be less than S, and K2 must be greater than S.

# See Also

<span id="page-27-1"></span>IRR *Internal Rate of Return*

#### Description

Calculates internal rate of return for a series of cash flows, and provides a time diagram of the cash flows.

# Usage

IRR(cf0,cf,times,plot=FALSE)

#### Arguments

# Details

$$
cf0 = \sum_{k=1}^{n} \frac{cf_k}{(1+irr)^{times_k}}
$$

#### Value

The internal rate of return.

# Note

Periods in t must be positive integers.

Uses polyroot function to solve equation given by series of cash flows, meaning that in the case of having a negative IRR, multiple answers may be returned.

<span id="page-27-0"></span>

<span id="page-42-1"></span>swap.commodity *Commodity Swap*

# Description

Solves for the fixed swap price, given the variable prices and interest rates (either as spot rates or zero coupon bond prices).

# Usage

```
swap.commodity(prices, rates, type="spot_rate")
```

# <span id="page-43-0"></span>Details

For spot rates: 
$$
\sum_{k=1}^{n} \frac{prices_k}{(1+rates_k)^k} = \sum_{k=1}^{n} \frac{X}{(1+rates_k)^k}
$$
  
For zero coupon bond prices: 
$$
\sum_{k=1}^{n} prices_k * rates_k = \sum_{k=1}^{n} X * rates_k
$$
  
Where  $X$  = fixed swap price.

# Value

The fixed swap price.

#### Note

Length of the price vector and rate vector must be of the same length.

#### Author(s)

Kameron Penn and Jack Schmidt

# See Also

[swap.rate](#page-43-1)

#### Examples

```
swap.commodity(prices=c(103,106,108), rates=c(.04,.05,.06))
swap.commodity(prices=c(103,106,108), rates=c(.9615,.907,.8396),type="zcb_price")
swap.commodity(prices=c(105,105,105), rates=c(.85,.89,.80),type="zcb_price")
```
<span id="page-43-1"></span>swap.rate *Interest Rate Swap*

# Description

Solves for the fixed interest rate given the variable interest rates (either as spot rates or zero coupon bond prices).

# Usage

swap.rate(rates, type="spot\_rate")

#### <span id="page-44-0"></span>TVM 45

# Details

For spot rates:  $1 = \sum_{k=1}^{n} \left[ \frac{R}{(1 + \text{rates}_k)^k} \right] + \frac{1}{(1 + \text{rates}_n)^n}$ For zero coupon bond prices:  $1 = \sum_{k=1}^{n} (R \times rates_k) + rates_n$ Where  $R =$  fixed swap rate.

#### Value

The fixed interest rate swap.

#### See Also

[swap.commodity](#page-42-1)

#### Examples

swap.rate(rates=c(.04, .05, .06), type = "spot\_rate")

```
swap.rate(rates=c(.93,.95,.98,.90), type = "zcb_price")
```
<span id="page-44-1"></span>TVM *Time Value of Money*

# Description

Solves for the present value, future value, time, or the interest rate for the accumulation of money earning compound interest. It can also plot the time value for each period.

# Usage

TVM(pv=NA,fv=NA,n=NA,i=NA,ic=1,plot=FALSE)

#### Arguments

# Details

 $j = (1 + \frac{i}{ic})^{ic} - 1$  $fv = pv * (1 + j)^n$ 

# <span id="page-45-0"></span>Value

Returns a matrix of the input variables and calculated unknown variables.

# Note

Exactly one of pv, fv, n, or i must be NA (unknown).

# See Also

[cf.analysis](#page-18-1)

# Examples

TVM(pv=10,fv=20,i=.05,ic=2,plot=TRUE)

TVM(pv=50,n=5,i=.04,plot=TRUE)

<span id="page-45-1"></span>yield.dollar *Dollar Weighted Yield*

# Description

Calculates the dollar weighted yield.

# Usage

yield.dollar(cf, times, start, end, endtime)

# Arguments

# Details

$$
I = end - start - \sum_{k=1}^{n} cf_k
$$
  

$$
i^{dw} = \frac{I}{start*endtime - \sum_{k=1}^{n} cf_k * (endtime - times_k)}
$$

# Value

The dollar weighted yield.

#### <span id="page-46-0"></span>yield.time **47**

# Note

Time of comparison (endtime) must be larger than any number in vector of cash flow times. Length of cashflow vector and times vector must be equal.
