Conf_bands *Confidence bands*

Conf_bands 5

Usage

```
Conf_bands(data, marker_name, event_time_name = 'years',
            time_name = 'year', event_name = 'status2', x, b)
```
Arguments

Details

The function [Conf_bands](#page-3-1) implements the pointwise and uniform confidence bands for the estimator of the future conditional hazard rate $\hat{h}_x(t)$. The confidence bands are based on a wild bootstrap approach $h^*_{x_*,B}(t)$.

Pointwise: For a given $t \in (0,T)$ generate $h^{*(1)}_{x_*,B}(t),...,h^{*(N)}_{x_*,B}(t)$ for $N = 1000$ and order it $h^{*[1]}_{x_*,B}(t) \leq ... \leq h^{*[N]}_{x_*,B}(t)$. Then

$$
\hat{I}_{n,N}^1 = \left[\hat{h}_{x_*}(t) - \hat{\sigma}_{G_{x_*}}(t) \frac{h^{*[N(1-\frac{\alpha}{2})]}(t)}{\sqrt{n}}, \hat{h}_{x_*}(t) - \hat{\sigma}_{G_x}(t) \frac{h^{*[N\frac{\alpha}{2}]}(t)}{\sqrt{n}} \right]
$$

is a 1 – α pointwise confidence band for $h_{x_*}(t)$, where $\hat{\sigma}_{G_{x_*}}(t)$ is a bootrap estimate of the variance. For more details on the wild bootstrap approach, please see [prep_boot](#page-18-1) and g _xt.

Uniform: Generate $\bar{h}_{x_*,B}^{(1)}(t),...,\bar{h}_{x_*,B}^{(N)}(t)$ for $N=1000$ for all $t \in [\delta_T, T-\delta_T]$ and define $W^{(i)}$ = $\sup_{t \in [0,T]} |\bar{h}_{x_*,B}^{(i)}(t)|$ for $i = 1, ..., N$. Order $W^{[1]} \leq ... \leq W^{[N]}$. Then

$$
\hat{I}_{n,N}^2 = \left[\hat{h}_{x_*}(t) \pm \hat{\sigma}_{G_{x_*}}(t) \frac{W^{[N(1-\alpha)]}}{\sqrt{n}} \right]
$$

is a 1 – α uniform confidence band for $h_{x*}(t)$.

Value

A list with pointwise, uniform confidence bands and the estimator $\hat{h}_x(t)$ for all possible time points t.

Details

The function [dataset_split](#page-5-1) takes a data frame and transforms it into $K = n/I$ data frames with *I* individuals missing from each data frame. Let I_j be sets of indices with $\bigcup_{j=1}^K I_j = \{1, ..., n\}$, $I_k \cap I_j = \emptyset$ and $|I_j| = |I_k| = I$ for all $j, k \in \{1, ..., K\}$. Then data frames with $\{1, ..., n\}/I_j$ individuals are created.

prep_boot *Precomputation for wild bootstrap*

Description

Implements key components for the wild bootstrap of the hqm estimator in preparation for obtaining confidence bands.

Usage

prep_boot(g_xt, alpha, Ni, Yi, size_s_grid, br_X, br_s, t, b, int_X, x, n)

The function implements

$$
A_B(t) = \frac{1}{\sqrt{n}} \sum_{i=1}^n \int_0^T \hat{g}_{i,t,x_*}(X_i(s)) V_i \{ dN_i(s) - \hat{\alpha}_i(X_i(s)) Z_i(s) ds \},
$$

and

$$
B_B(t) = \frac{1}{\sqrt{n}} \sum_{i=1}^n V_i \{\hat{\Gamma}(t, x_*)^{-1} W_i(t, x_*) - \hat{h}_{x_*}(t)\},
$$

where $V \sim N(0, 1)$,

$$
W_i(t) = \int_0^T \hat{\alpha}_i (X_i(t+s)) Z_i(t+s) Z_i(s) K_b(x_*, X_i(s)) ds,
$$

and

$$
\hat{\Gamma}(t,x) = \frac{1}{n} \sum_{i=1}^{n} \int_{0}^{T-t} Z_i(t+s) Z_i(s) K_b(x, X_i(s)) ds,
$$

with Z being the exposure and X the marker.

Value

A list of 5 items. The first two are vectors for calculating A_B and the third one a vector for B_B . The 4th one is the value of the hqm estimator that can also be obtained by $h_{\mathbf{r}} \times t$ and the last one is the value of Γ.

prep_cv *Prepare for Cross validation bandwidth selection*

Description

Implements the calculation of the hqm estimator on cross validation data sets. This is a preparation for the cross validation bandwidth selection technique for future conditional hazard rate estimation based on marker information data.

        time_name = 'year',event_name = 'status2', n, I, b)
```

The function splits the data set via [dataset_split](#page-5-1) and calculates for every splitted data set the hqm estimator

$$
\hat{h}_x(t) = \frac{\sum_{i=1}^n \int_0^T \hat{\alpha}_i (X_i(t+s)) Z_i(t+s) Z_i(s) K_b(x-X_i(s)) ds}{\sum_{i=1}^n \int_0^T Z_i(t+s) Z_i(s) K_b(x-X_i(s)) ds},
$$

```
Description

Calculates a part for the K-fold cross validation score.

Usage

R_K(h_xt_mat_list, int_X, size_X_grid, Yi, Ni, n)

Arguments

Details

The function implements the estimator

$$
\hat{R}_K = \sum_{j=1}^K \sum_{i \in I_j} \int_0^T g_i^{-I_j}(t) dN_i(t),
$$

where $\hat{g}_i^{-1}(t) = \int_0^t Z_i(s)\hat{h}_{X_i(s)}^{-1}(t-s)ds$, and \hat{h}^{-1} is estimated without information from all counting processes i with $i \in I_j$. This function estimates

$$
R = \sum_{i=1}^{N} \int_{0}^{T} \int_{s}^{T} Z_{i}(t)Z_{i}(s)\hat{h}_{X_{i}(s)}(t-s)h_{X_{i}(s)}(t-s)dtds.
$$

where \hat{h} is the hqm estimator, Z the exposure and X the marker.

Value

A matrix with $\hat{g}_i^{-I_j}(t)$ for all individuals i and time grid points t.

to_id *Event data frame*

Description

Creates a data frame with only one entry per individual from a data frame with time dependent data. The resulting data frame focusses on the event time and the last observed marker value.

Usage

```
to_id(data_set)
```
Arguments

data_set A data frame of time dependent data points. Missing values are allowed.

Details

The function [to_id](#page-24-1) uses a data frame of time dependent marker data to create a smaller data frame with only one entry per individual, the last observed marker value and the event time. Note that the column indicating the individuals must have the name id. Note also that this data frame is similar to pbc2.id from the JM package with the difference that the last observed marker value instead of the first one is captured.

Value

A data frame with only one entry per individual.

Examples

data_set.id = to_id(pbc2)
