

# Package: OSTE (via r-universe)

August 21, 2024

**Type** Package

**Title** Optimal Survival Trees Ensemble

**Version** 1.0

**Date** 2021-11-07

**Maintainer** Naz Gul <nazgul@awkum.edu.pk>

**Description** Function for growing survival trees ensemble ('Naz Gul', 'Nosheen Faiz', 'Dan Brawn', 'Rafal Kulakowski', 'Zardad Khan', and 'Berthold Lausen' (2020) <[arXiv:2005.09043](https://arxiv.org/abs/2005.09043)>) is given. The trees are grown by the method of random survival forest ('Marvin Wright', 'Andreas Ziegler' (2017) <[doi:10.18637/jss.v077.i01](https://doi.org/10.18637/jss.v077.i01)>). The survival trees grown are assessed for both individual and collective performances. The ensemble can give promising results on fewer survival trees selected in the final ensemble.

**Imports** ranger, pec, stats, survival, proclim

**LazyLoad** yes

**License** GPL (>= 3.5.0)

**NeedsCompilation** no

**Author** Naz Gul [aut, cre], Nosheen Faiz [ctb], Zardad Khan [aut],  
Berthold Lausen [aut]

**Repository** CRAN

**Date/Publication** 2021-11-19 14:50:09 UTC

OSTE-package

*Optimal Survival Trees Ensembles*

---

### Description

This package consists of function for growing survival trees ensemble, that are grown by the method of random survival forest. The survival trees grown are assessed for both individual and collective performances. The ensemble can give promising results on fewer survival trees selected based on their individual and collective performance in the final ensemble.

### Details

Package: OSTE  
Type: Package  
Version: 1.0  
Date: 2021-11-07  
License: GPL (>= 3.5.0)

### Author(s)

Naz Gul, Nosheen Faiz, Zardad Khan and Berthold Lausen.

Maintainer: Naz Gul <nazgul@awkum.edu.pk>

### References

OSTE

*Optimal Survival Tree Ensemble*

---

### Description

Optimal survival trees ensemble is the main function of OSTE package that grows a sufficiently large number, `t.initial`, of survival trees and selects optimal survival trees from the total trees grown by random survival forest. Number of survival trees in the initial set, `t.initial`, is chosen by the user. If not chosen, then the default `t.initial = 500` is used. Based on empirical investigation, `t.initial = 1000` is recommended.

**Usage**

```
OSTE(formula = NULL, data, t.initial = NULL, v.size = NULL, mtry = NULL, M = NULL,
      minimum.node.size = NULL, always.split.features = NULL, replace = TRUE,
      splitting.rule = NULL, info = TRUE)
```

**Arguments**

<code>formula</code>	Object of class <code>formula</code> describing the required model to be fitted. Interaction terms are not supported in the current version.
<code>data</code>	A <code>nxd</code> matrix or data frame of <code>n</code> observations on <code>d</code> features along with response variables that are described by the <code>formula</code> .
<code>t.initial</code>	Number of survival trees to be grown initially. If equal to <code>NULL</code> then the default of <code>t.initial = 500</code> is taken. A recommended value is <code>t.initial = 1000</code> .
<code>v.size</code>	Portion of data used for validation in the second phase i.e. for assessing survival trees performance in the ensemble. If equal to <code>NULL</code> then the default <code>v.size=0.1</code>
<code>mtry</code>	Number of features selected at random at each node of the survival trees for splitting. If equal to <code>NULL</code> then the default <code>sqrt(d)</code> is taken.
<code>M</code>	Percent of the best <code>t.initial</code> survival trees to be selected on the basis of their performance on out-of-bag observations. For selecting 20% of trees, take <code>M=0.2</code> .
<code>minimum.node.size</code>	Minimal node size. If equal to <code>NULL</code> then the default <code>minimum.node.size = 3</code> is executed.
<code>always.split.features</code>	Vector of variable names if desired to be always selected in addition to the <code>mtry</code> variables tried for splitting.
<code>replace</code>	Whether sampling should be done with or without replacement.
<code>splitting.rule</code>	Splitting rule. "logrank", "C" or "maxstat" are supported with default "logrank".
<code>info</code>	If <code>TRUE</code> , displays process status .

**Details**

Large values are recommended for `t.initial` for better performance as possible under the available computational resources. The log-rank test statistic is used as default, A C-index based splitting rule (Schmid et al. 2015) and maximally selected rank statistics (Wright et al. 2016) are available. The C-index shows better predictive performance in case of high censoring rate, where logrank is best for situations where the data are noisy (Schmid et al. 2015).

**Value**

<code>unique.death.times</code>	Unique death times.
<code>CHF</code>	Estimated cumulative hazard function for each observation.
<code>Survival_Prob</code>	Estimated survival probability for each observation.
<code>trees_selected</code>	Number of trees selected.
<code>mtry</code>	Value of <code>mtry</code> used.
<code>forest</code>	Saved forest for prediction purposes.

**Note**

In the case of missing values in any dataset prior action needs to be taken as the function can not handle them at the current version. Moreover, the status/delta variable in the data must be code as 0, 1.

VETERAN

*Data on randomized trial of two treatment procedures for lung cancer.*

---

### Description

The data set consist of a total 137 observations on 8 variables. The variables consist of the type of lung cancer treatment i.e 1 (standard) and 2 (test drug), cell Type, Status, that denotes the status of the patient as 1 (dead) or 0 (alive), survival time in days since the treatment, Diag, the time since diagnosis in months, age in years, the Karnofsky score, therapy that denotes any prior therapy 0 (none), 1 (yes).

**Usage**

```
data("VETERAN")
```

**Format**

A data frame with 137 observations on the following 8 variables.

`trt` a numeric vector denoting type of lung cancer treatment i.e 1 (standard) and 2 (test drug).

`celltype` a factor with levels `squamous`, `smallcell`, `adeno` and `large`.

`time` a numeric vector denoting survival time in days since the treatment.

`status` a numeric vector that denotes the status of the patient as 1 (dead) or 0 (alive).

`karno` a numeric vector denoting the Karnofsky score.

`diagtime` a numeric vector denoting the time since diagnosis in months.

`age` age in years.

`prior` a numeric vector denoting prior therapy; 0 (none), 1 (yes).
