Package: ambiorix (via r-universe)

March 15, 2025

Title Web Framework Inspired by 'Express.js'

Version 2.2.0

Description A web framework inspired by 'express.js' to build any web service from multi-page websites to 'RESTful' application programming interfaces.

License GPL (>= 3)

Encoding UTF-8

RoxygenNote 7.3.2

Imports fs, log, cli, glue, httpuv, methods, assertthat, webutils (>= 1.2.0), yyjsonr (>= 0.1.20)

Suggests mime, readr, readxl, ggplot2, promises, jsonlite, websocket, htmltools, commonmark, htmlwidgets, testthat (>= 3.0.0)

`Ambiorix` *Ambiorix*

Description

Web server.

Value

An object of class `Ambiorix` from which one can add routes, routers, and run the application.

Super class

`ambiorix::Routing` -> `Ambiorix`

Public fields

`not_found` 404 Response, must be a handler function that accepts the request and the response, by default uses `response_404()`.

`error` 500 response when the route errors, must a handler function that accepts the request and the response, by default uses `response_500()`.

`on_stop` Callback function to run when the app stops, takes no argument.

Active bindings

`port` Port to run the application.

`host` Host to run the application.

`limit` Max body size, defaults to `5 * 1024 * 1024`.

Methods

Public methods:

- `Ambiorix$new()`
- `Ambiorix$cache_templates()`
- `Ambiorix$listen()`
- `Ambiorix$set_404()`
- `Ambiorix$set_error()`
- `Ambiorix$static()`
- `Ambiorix$start()`
- `Ambiorix$serialiser()`
- `Ambiorix$stop()`
- `Ambiorix$print()`
- `Ambiorix$clone()`

Method `new()`:

Usage:

```
Ambiorix$new(
  host = getOption("ambiorix.host", "0.0.0.0"),
  port = getOption("ambiorix.port", NULL),
  log = getOption("ambiorix.logger", TRUE)
)
```

Arguments:

`host` A string defining the host.

`port` Integer defining the port, defaults to `ambiorix.port` option: uses a random port if `NULL`.

`log` Whether to generate a log of events.

Details: Define the webserver.

Method `cache_templates()`:

Usage:

```
Ambiorix$cache_templates()
```

Details: Cache templates in memory instead of reading them from disk.

Method `listen()`**:**

Usage:

```
Ambiorix$listen(port)
```

Arguments:

`port` Port number.

Details: Specifies the port to listen on.

Examples:

```
app <- Ambiorix$new()

app$listen(3000L)

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()
```

Method `set_404()`**:**

Usage:

```
Ambiorix$set_404(handler)
```

Arguments:

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

Details: Sets the 404 page.

Examples:

```
app <- Ambiorix$new()

app$set_404(function(req, res){
 res$send("Nothing found here")
})

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()
```

Method `set_error()`**:**

Usage:

```
Ambiorix$set_error(handler)
```

Arguments:

`handler` Function that accepts a request, response and an error object.

Details: Sets the error handler.

Examples:

```
# my custom error handler:
error_handler <- function(req, res, error) {
  if (!is.null(error)) {
    error_msg <- conditionMessage(error)
    cli::cli_alert_danger("Error: {error_msg}")
  }
  response <- list(
    code = 500L,
    msg = "Uhhmmm... Looks like there's an error from our side :("
  )
  res$
    set_status(500L)$
    json(response)
}

# handler for GET at /whoami:
whoami <- function(req, res) {
  # simulate error (object 'Pikachu' is not defined)
  print(Pikachu)
}

app <- Ambiorix$
  new()$
  set_error(error_handler)$
  get("/whoami", whoami)

if (interactive()) {
  app$start(open = FALSE)
}
```

Method `static()`**:**

Usage:

```
Ambiorix$static(path, uri = "www")
```

Arguments:

`path` Local path to directory of assets.

`uri` URL path where the directory will be available.

Details: Static directories

Method `start()`**:**

Usage:

```
Ambiorix$start(port = NULL, host = NULL, open = interactive())
```

Arguments:

`port` Integer defining the port, defaults to `ambiorix.port` option: uses a random port if `NULL`.

`host` A string defining the host.

`open` Whether to open the app the browser.

Details: Start Start the webserver.

Examples:

```
app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start(port = 3000L)
```

Method `serialiser()`**:**

Usage:

```
Ambiorix$serialiser(handler)
```

Arguments:

`handler` Function to use to serialise. This function should accept two arguments: the object to serialise and `...`.

Details: Define Serialiser

Examples:

```
app <- Ambiorix$new()

app$serialiser(function(data, ...){
 jsonlite::toJSON(x, ..., pretty = TRUE)
})

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()
```

Method `stop()`**:**

Usage:

```
Ambiorix$stop()
```

Details: Stop Stop the webserver.

Method `print()`**:**

Usage:

```
Ambiorix$print()
```

Details: Print

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Ambiorix$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

app$on_stop <- function(){
 cat("Bye!\n")
}

if(interactive())
 app$start()

## ------------------------------------------------
## Method `Ambiorix$listen`
## ------------------------------------------------

app <- Ambiorix$new()

app$listen(3000L)

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()

## ------------------------------------------------
## Method `Ambiorix$set_404`
## ------------------------------------------------

app <- Ambiorix$new()

app$set_404(function(req, res){
 res$send("Nothing found here")
})

app$get("/", function(req, res){
```

```
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()

## ------------------------------------------------
## Method `Ambiorix$set_error`
## ------------------------------------------------

# my custom error handler:
error_handler <- function(req, res, error) {
  if (!is.null(error)) {
    error_msg <- conditionMessage(error)
    cli::cli_alert_danger("Error: {error_msg}")
  }
  response <- list(
    code = 500L,
    msg = "Uhhmmm... Looks like there's an error from our side :("
  )
  res$
    set_status(500L)$
    json(response)
}

# handler for GET at /whoami:
whoami <- function(req, res) {
  # simulate error (object 'Pikachu' is not defined)
  print(Pikachu)
}

app <- Ambiorix$
  new()$
  set_error(error_handler)$
  get("/whoami", whoami)

if (interactive()) {
  app$start(open = FALSE)
}

## ------------------------------------------------
## Method `Ambiorix$start`
## ------------------------------------------------

app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start(port = 3000L)
```

```
## ------------------------------------------------
## Method `Ambiorix$serialiser`
## ------------------------------------------------

app <- Ambiorix$new()

app$serialiser(function(data, ...){
 jsonlite::toJSON(x, ..., pretty = TRUE)
})

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()
```

`as_cookie_parser` *Define a Cookie Parser*

Description

Identifies a function as a cookie parser (see example).

Usage

```
as_cookie_parser(fn)
```

Arguments

`fn`	A function that accepts a single argument, `req` the Request and returns the parsed cookie string, generally a `list`. Note that the original cookie string is available on the Request at the `HTTP_COOKIE` field, get it with: `req$HTTP_COOKIE`

Value

Object of class "cookieParser".

Examples

```
func <- function(req) {
 req$HTTP_COOKIE
}

parser <- as_cookie_parser(func)

app <- Ambiorix$new()
app$use(parser)
```

as_cookie_preprocessor *Define a Cookie Preprocessor*

Description

Identifies a function as a cookie preprocessor.

Usage

```
as_cookie_preprocessor(fn)
```

Arguments

fn	A function that accepts the same arguments as the cookie method of the Response class (name, value, ...), and returns a modified value.

Value

Object of class "cookiePreprocessor".

Examples

```
func <- function(name, value, ...) {
 sprintf("prefix.%s", value)
}

prep <- as_cookie_preprocessor(func)

app <- Ambiorix$new()
app$use(prep)
```

as_path_to_pattern *Path to pattern*

Description

Identify a function as a path to pattern function; a function that accepts a path and returns a matching pattern.

Usage

```
as_path_to_pattern(path)
```

Arguments

path	A function that accepts a character vector of length 1 and returns another character vector of length 1.

Value

Object of class "pathToPattern".

Examples

```
fn <- function(path) {
  pattern <- gsub(":([^/]+)", "(\\\\w+)", path)
  paste0("^", pattern, "$")
}

path_to_pattern <- as_path_to_pattern(fn)

path <- "/dashboard/profile/:user_id"
pattern <- path_to_pattern(path) # "^/dashboard/profile/(\w+)$"
```

---

as_renderer *Create a Renderer*

Description

Create a custom renderer.

Usage

```
as_renderer(fn)
```

Arguments

fn	A function that accepts two arguments, the full path to the `file` to render, and the `data` to render.

Value

A renderer function.

Examples

```
if (interactive()) {
  fn <- function(path, data) {
    # ...
  }

  as_renderer(fn)
}
```

content *Content Headers*

Description

Convenient functions for more readable content type headers.

Usage

```
content_html()

content_plain()

content_json()

content_csv()

content_tsv()

content_protobuf()
```

Value

Length 1 character vector.

Examples

```
list(
 "Content-Type",
 content_json()
)

if(FALSE)
 req$header(
  "Content-Type",
  content_json()
 )
```

create_dockerfile *Dockerfile*

Description

Create the dockerfile required to run the application. The dockerfile created will install packages from RStudio Public Package Manager which comes with pre-built binaries that much improve the speed of building of Dockerfiles.

Usage

```
create_dockerfile(port, host = "0.0.0.0", file_path)
```

Arguments

port, host	Port and host to serve the application.
file_path	String. Path to file to write to.

Details

Reads the DESCRIPTION file of the project to produce the Dockerfile.

Value

NULL (invisibly)

Examples

```
if (interactive()) {
  create_dockerfile(port = 5000L, host = "0.0.0.0", file_path = tempfile())
  # create_dockerfile(port = 5000L, host = "0.0.0.0", file_path = "Dockerfile")
}
```

---

default_cookie_parser *Cookie Parser*

Description

Parses the cookie string.

Usage

```
default_cookie_parser(req)
```

Arguments

req	A Request.

Value

A list of key value pairs or cookie values.

Examples

```
if (interactive()) {
  library(ambiorix)

  #' Handle GET at '/greet'
  #'
  #' @export
  say_hello <- function(req, res) {
    cookies <- default_cookie_parser(req)
    print(cookies)

    res$send("hello there!")
  }

  app <- Ambiorix$new()
  app$get("/greet", say_hello)
  app$start()
}
```

`forward` *Forward Method*

Description

Makes it such that the web server skips this method and uses the next one in line instead.

Usage

```
forward()
```

Value

An object of class `forward`.

Examples

```
app <- Ambiorix$new()

app$get("/next", function(req, res){
 forward()
})

app$get("/next", function(req, res){
 res$send("Hello")
})

if(interactive())
 app$start()
```

import *Import Files*

Description

Import all R-files in a directory.

Usage

```
import(...)
```

Arguments

`...`	Directory from which to import `.R` or `.r` files.

Value

Invisibly returns `NULL`.

Examples

```
if (interactive()) {
  import("views")
}
```

jobj *JSON Object*

Description

Serialises an object to JSON in `res$render`.

Usage

```
jobj(obj)
```

Arguments

`obj`	Object to serialise.

Value

Object of class "jobj".

Examples

```
if (interactive()) {
  l <- list(a = "hello", b = 2L, c = 3)
  jobj(l)
}
```

---

mockRequest *Mock Request*

Description

Mock a request, used for tests.

Usage

```
mockRequest(cookie = "", query = "", path = "/")
```

Arguments

cookie	Cookie string.
query	Query string.
path	Path string.

Value

A Request object.

Examples

```
mockRequest()
```

---

new_log *Logger*

Description

Returns a new logger using the log package.

Usage

```
new_log(prefix = ">", write = FALSE, file = "ambiorix.log", sep = "")
```

Arguments

prefix	String to prefix all log messages.
write	Whether to write the log to the file.
file	Name of the file to dump the logs to, only used if write is TRUE.
sep	Separator between prefix and other flags and messages.

Value

An R& of class log::Logger.

Examples

```
log <- new_log()
log$log("Hello world")
```

---

parse_form_urlencoded *Parse application/x-www-form-urlencoded data*

Description

This function parses application/x-www-form-urlencoded data, typically used in form submissions.

Usage

```
parse_form_urlencoded(req, ...)
```

Arguments

req	The request object.
...	Additional parameters passed to the parser function.

Details

Overriding Default Parser:

By default, parse_form_urlencoded() uses webutils::parse_http(). You can override this globally by setting the AMBIORIX_FORM_URLENCODED_PARSER option:

```
options(AMBIORIX_FORM_URLENCODED_PARSER = my_other_custom_parser)
```

Your custom parser function *MUST* accept the following parameters:

1. body: Raw vector containing the form data.
2. ...: Additional optional parameters.

Value

A list of parsed form fields, with each key representing a form field name and each value representing the form field's value.

Named list

See Also

parse_multipart(), parse_json()

Examples

```
if (interactive()) {
  library(ambiorix)
  library(htmltools)
  library(readxl)

  page_links <- function() {
    Map(
      f = function(href, label) {
        tags$a(href = href, label)
      },
      c("/", "/about", "/contact"),
      c("Home", "About", "Contact")
    )
  }

  forms <- function() {
    form1 <- tags$form(
      action = "/url-form-encoded",
      method = "POST",
      enctype = "application/x-www-form-urlencoded",
      tags$h4("form-url-encoded:"),
      tags$label(`for` = "first_name", "First Name"),
      tags$input(id = "first_name", name = "first_name", value = "John"),
      tags$label(`for` = "last_name", "Last Name"),
      tags$input(id = "last_name", name = "last_name", value = "Coene"),
      tags$button(type = "submit", "Submit")
    )

    form2 <- tags$form(
      action = "/multipart-form-data",
      method = "POST",
      enctype = "multipart/form-data",
      tags$h4("multipart/form-data:"),
      tags$label(`for` = "email", "Email"),
      tags$input(id = "email", name = "email", value = "john@mail.com"),
      tags$label(`for` = "framework", "Framework"),
      tags$input(id = "framework", name = "framework", value = "ambiorix"),
      tags$label(`for` = "file", "Upload CSV file"),
      tags$input(type = "file", id = "file", name = "file", accept = ".csv"),
      tags$label(`for` = "file2", "Upload xlsx file"),
```

```
    tags$input(type = "file", id = "file2", name = "file2", accept = ".xlsx"),
    tags$button(type = "submit", "Submit")
  )

  tagList(form1, form2)
}

home_get <- function(req, res) {
  html <- tagList(
    page_links(),
    tags$h3("hello, world!"),
    forms()
  )

  res$send(html)
}

home_post <- function(req, res) {
  body <- parse_json(req)
  # print(body)

  get("/contact", contact_get)$
  post("/url-form-encoded", url_form_encoded_post)$
  post("/multipart-form-data", multipart_form_data_post)

app$start()
}
```

`parse_json` *Parse application/json data*

Description

This function parses JSON data from the request body.

Usage

```
parse_json(req, ...)
```

Arguments

`req`	The request object.
`...`	Additional parameters passed to the parser function.

Details

Overriding Default Parser:

By default, `parse_json()` uses `yyjsonr::read_json_raw()` for JSON parsing. You can override this globally by setting the `AMBIORIX_JSON_PARSER` option:

```
my_json_parser <- function(body, ...) {
  txt <- rawToChar(body)
  jsonlite::fromJSON(txt, ...)
}
options(AMBIORIX_JSON_PARSER = my_json_parser)
```

Your custom parser *MUST* accept the following parameters:

1. body: Raw vector containing the JSON data.
2. ...: Additional optional parameters.

Value

An R object (e.g., list or data frame) parsed from the JSON data.

Named list

app$start()
}
```

`parse_multipart` *Parse multipart form data*

Description

Parses multipart form data, including file uploads, and returns the parsed fields as a list.

Usage

```
parse_multipart(req, ...)
```

Arguments

`req`	The request object.
`...`	Additional parameters passed to the parser function.

Details

If a field is a file upload it is returned as a named list with:

- `value`: Raw vector representing the file contents. You must process this further (eg. convert to data.frame). See the examples section.
- `content_disposition`: Typically "form-data", indicating how the content is meant to be handled.
- `content_type`: MIME type of the uploaded file (e.g., "image/png" or "application/pdf").
- `name`: Name of the form input field.
- `filename`: Original name of the uploaded file.

If no body data, an empty list is returned.

Overriding Default Parser:

By default, `parse_multipart()` uses `webutils::parse_http()` internally. You can override this globally by setting the `AMBIORIX_MULTIPART_FORM_DATA_PARSER` option:

```
options(AMBIORIX_MULTIPART_FORM_DATA_PARSER = my_custom_parser)
```

Your custom parser function must accept the following parameters:

1. `body`: Raw vector containing the form data.
2. `content_type`: The 'Content-Type' header of the request as defined by the client.
3. `...`: Additional optional parameters.

Value

Named list.

pre_hook *Pre Hook Response*

Description

Pre Hook Response

Usage

```
pre_hook(content, data)
```

Arguments

content	File content, a character vector.
data	A list of data passed to glue::glue_data.

Value

A response pre-hook.

Examples

```
my_prh <- function(self, content, data, ext, ...) {
  data$title <- "Mansion"
  pre_hook(content, data)
}

#' Handler for GET at '/'
#'
#' @details Renders the homepage
#' @export
home_get <- function(req, res) {
  res$pre_render_hook(my_prh)
  res$render(
    file = "page.html",
    data = list(
      title = "Home"
    )
  )
}
```

Request *Request*

Description

A request.

Value

A Request object.

Public fields

`HEADERS` Headers from the request.

`HTTP_ACCEPT` Content types to accept.

`HTTP_ACCEPT_ENCODING` Encoding of the request.

`HTTP_ACCEPT_LANGUAGE` Language of the request.

`HTTP_CACHE_CONTROL` Directorives for the cache (case-insensitive).

`HTTP_CONNECTION` Controls whether the network connection stays open after the current transaction finishes.

`HTTP_COOKIE` Cookie data.

`HTTP_HOST` Host making the request.

`HTTP_SEC_FETCH_DEST` Indicates the request's destination. That is the initiator of the original fetch request, which is where (and how) the fetched data will be used.

`HTTP_SEC_FETCH_MODE` Indicates mode of the request.

`HTTP_SEC_FETCH_SITE` Indicates the relationship between a request initiator's origin and the origin of the requested resource.

`HTTP_SEC_FETCH_USER` Only sent for requests initiated by user activation, and its value will always be `?1`.

`HTTP_UPGRADE_INSECURE_REQUESTS` Signals that server supports upgrade.

`HTTP_USER_AGENT` User agent.

`SERVER_NAME` Name of the server.

`httpuv.version` Version of httpuv.

`PATH_INFO` Path of the request.

`QUERY_STRING` Query string of the request.

`REMOTE_ADDR` Remote address.

`REMOTE_PORT` Remote port.

`REQUEST_METHOD` Method of the request, e.g.: `GET`.

`rook.errors` Errors from rook.

`rook.input` Rook inputs.

`rook.url_scheme` Rook url scheme.

`rook.version` Rook version.

`SCRIPT_NAME` The initial portion of the request URL's "path" that corresponds to the application object, so that the application knows its virtual "location". #' @field SERVER_NAME Server name.

`SERVER_PORT` Server port

`CONTENT_LENGTH` Size of the message body.

`CONTENT_TYPE` Type of content of the request.

`HTTP_REFERER` Contains an absolute or partial address of the page that makes the request.

`body` Request, an environment.

`query` Parsed `QUERY_STRING`, `list`.

`params` A `list` of parameters.

`cookie` Parsed `HTTP_COOKIE`.

Methods

Public methods:

- `Request$new()`
- `Request$print()`
- `Request$get_header()`
- `Request$parse_multipart()`
- `Request$parse_json()`
- `Request$clone()`

Method `new()`**:**

Usage:

```
Request$new(req)
```

Arguments:

`req` Original request (environment).

Details: Constructor

Method `print()`**:**

Usage:

```
Request$print()
```

Details: Print

Method `get_header()`**:**

Usage:

```
Request$get_header(name)
```

Arguments:

`name` Name of the header

Details: Get Header

Method `parse_multipart()`**:**

Usage:

```
Request$parse_multipart()
```

Details: Parse Multipart encoded data

Method `parse_json()`**:**

Usage:

```
Request$parse_json(...)
```

Arguments:

`...` Arguments passed to `parse_json()`.

Details: Parse JSON encoded data

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Request$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
if (interactive()) {
  library(ambiorix)

  app <- Ambiorix$new()

  app$get("/", function(req, res) {
    print(req)
    res$send("Using {ambiorix}!")
  })

  app$start()
}
```

`Response` *Response*

Description

Response class to generate responses sent from the server.

Value

A Response object.

Active bindings

`status` Status of the response, defaults to `200L`.

`headers` Named list of headers.

Methods

Public methods:

- `Response$set_status()`
- `Response$send()`
- `Response$sendf()`
- `Response$text()`
- `Response$send_file()`
- `Response$redirect()`
- `Response$render()`
- `Response$json()`
- `Response$csv()`
- `Response$tsv()`
- `Response$htmlwidget()`
- `Response$md()`

- Response$png()
- Response$jpeg()
- Response$image()
- Response$ggplot2()
- Response$print()
- Response$set()
- Response$get()
- Response$header()
- Response$header_content_json()
- Response$header_content_html()
- Response$header_content_plain()
- Response$header_content_csv()
- Response$header_content_tsv()
- Response$get_headers()
- Response$get_header()
- Response$set_headers()
- Response$set_header()
- Response$pre_render_hook()
- Response$post_render_hook()
- Response$cookie()
- Response$clear_cookie()
- Response$clone()

Method `set_status()`**:**

Usage:

```
Response$set_status(status)
```

Arguments:

`status` An integer defining the status.

Details: Set the status of the response.

Method `send()`**:**

Usage:

```
Response$send(body, headers = NULL, status = NULL)
```

Arguments:

`body` Body of the response.

`headers` HTTP headers to set.

`status` Status of the response, if `NULL` uses `self$status`.

Details: Send a plain HTML response.

Method `sendf()`**:**

Usage:

```
Response$sendf(body, ..., headers = NULL, status = NULL)
```

Arguments:

`body` Body of the response.

`...` Passed to `...` of `sprintf`.

`headers` HTTP headers to set.

`status` Status of the response, if `NULL` uses `self$status`.

Details: Send a plain HTML response, pre-processed with sprintf.

Method `text()`**:**

Usage:

```
Response$text(body, headers = NULL, status = NULL)
```

Arguments:

`body` Body of the response.

`headers` HTTP headers to set.

`status` Status of the response, if `NULL` uses `self$status`.

Details: Send a plain text response.

Method `send_file()`**:**

Usage:

```
Response$send_file(file, headers = NULL, status = NULL)
```

Arguments:

`file` File to send.

`headers` HTTP headers to set.

`status` Status of the response.

Details: Send a file.

Method `redirect()`**:**

Usage:

```
Response$redirect(path, status = NULL)
```

Arguments:

`path` Path or URL to redirect to.

`status` Status of the response, if `NULL` uses `self$status`.

Details: Redirect to a path or URL.

Method `render()`**:**

Usage:

```
Response$render(file, data = list(), headers = NULL, status = NULL)
```

Arguments:

`file` Template file.

`data` List to fill `[% tags %]`.

`headers` HTTP headers to set.

`status` Status of the response, if `NULL` uses `self$status`.

Details: Render a template file.

Method `json()`**:**

Usage:

```
Response$json(body, headers = NULL, status = NULL, ...)
```

Arguments:

`body` Body of the response.

`headers` HTTP headers to set.

`status` Status of the response, if `NULL` uses `self$status`.

`...` Additional named arguments passed to the serialiser.

Details: Render an object as JSON.

Method `csv()`**:**

Usage:

```
Response$csv(data, name = "data", status = NULL, ...)
```

Arguments:

`data` Data to convert to CSV.

`name` Name of the file.

`status` Status of the response, if `NULL` uses `self$status`.

`...` Additional arguments passed to `readr::format_csv()`.

Details: Sends a comma separated value file

Method `tsv()`**:**

Usage:

```
Response$tsv(data, name = "data", status = NULL, ...)
```

Arguments:

`data` Data to convert to CSV.

`name` Name of the file.

`status` Status of the response, if `NULL` uses `self$status`.

`...` Additional arguments passed to `readr::format_tsv()`.

Details: Sends a tab separated value file

Method `htmlwidget()`**:**

Usage:

```
Response$htmlwidget(widget, status = NULL, ...)
```

Arguments:

`widget` The widget to use.

`status` Status of the response, if `NULL` uses `self$status`.

`...` Additional arguments passed to `htmlwidgets::saveWidget()`.

Details: Sends an htmlwidget.

Method `md()`**:**

Usage:

```
Response$md(file, data = list(), headers = NULL, status = NULL)
```

Arguments:

`file` Template file.

`data` List to fill `[% tags %]`.

`headers` HTTP headers to set.

`status` Status of the response, if `NULL` uses `self$status`.

Details: Render a markdown file.

Method `png()`**:**

Usage:

```
Response$png(file)
```

Arguments:

`file` Path to local file.

Details: Send a png file

Method `jpeg()`**:**

Usage:

```
Response$jpeg(file)
```

Arguments:

`file` Path to local file.

Details: Send a jpeg file

Method `image()`**:**

Usage:

```
Response$image(file)
```

Arguments:

`file` Path to local file.

Details: Send an image Similar to png and `jpeg` methods but guesses correct method based on file extension.

Method `ggplot2()`**:**

Usage:

```
Response$ggplot2(plot, ..., type = c("png", "jpeg"))
```

Arguments:

`plot` Ggplot2 plot object.

`...` Passed to `ggplot2::ggsave()`

`type` Type of image to save.

Details: Ggplot2

Method `print()`**:**

Usage:

```
Response$print()
```

Details: Print

Method `set()`**:**

Usage:

```
Response$set(name, value)
```

Arguments:

`name` String. Name of the variable.
`value` Value of the variable.

Details: Set Data

Returns: Invisible returns self.

Method `get()`**:**

Usage:

```
Response$get(name)
```

Arguments:

`name` String. Name of the variable to get.

Details: Get data

Method `header()`**:**

Usage:

```
Response$header(name, value)
```

Arguments:

`name` String. Name of the header.
`value` Value of the header.

Details: Add headers to the response.

Returns: Invisibly returns self.

Method `header_content_json()`**:**

Usage:

```
Response$header_content_json()
```

Details: Set Content Type to JSON

Returns: Invisibly returns self.

Method `header_content_html()`**:**

Usage:

```
Response$header_content_html()
```

Details: Set Content Type to HTML

Returns: Invisibly returns self.

Method `header_content_plain()`**:**

Usage:

```
Response$header_content_plain()
```

Details: Set Content Type to Plain Text

Returns: Invisibly returns self.

Method `header_content_csv()`**:**

Usage:

```
Response$header_content_csv()
```

Details: Set Content Type to CSV

Returns: Invisibly returns self.

Method `header_content_tsv()`**:**

Usage:

```
Response$header_content_tsv()
```

Details: Set Content Type to TSV

Returns: Invisibly returns self.

Method `get_headers()`**:**

Usage:

```
Response$get_headers()
```

Details: Get headers Returns the list of headers currently set.

Method `get_header()`**:**

Usage:

```
Response$get_header(name)
```

Arguments:

`name` Name of the header to return.

Details: Get a header Returns a single header currently, `NULL` if not set.

Method `set_headers()`**:**

Usage:

```
Response$set_headers(headers)
```

Arguments:

`headers` A named list of headers to set.

Details: Set headers

Method `set_header()`**:**

Usage:

```
Response$set_header(name, value)
```

Arguments:

`name` Name of the header.

value Value to set.

Details: Set a Header

Returns: Invisible returns self.

Method `pre_render_hook()`**:**

Usage:

```
Response$pre_render_hook(hook)
```

Arguments:

hook A function that accepts at least 4 arguments:

- `self`: The `Request` class instance.
- `content`: File content a vector of character string, content of the template.
- `data`: `list` passed from `render` method.
- `ext`: File extension of the template file.

This function is used to add pre-render hooks to the `render` method. The function should return an object of class `responsePreHook` as obtained by `pre_hook()`. This is meant to be used by middlewares to, if necessary, pre-process rendered data.
Include `...` in your hook to ensure it will handle potential updates to hooks in the future.

Details: Add a pre render hook. Runs before the `render` and `send_file` method.

Returns: Invisible returns self.

Method `post_render_hook()`**:**

Usage:

```
Response$post_render_hook(hook)
```

Arguments:

hook A function to run after the rendering of HTML. It should accept at least 3 arguments:

- `self`: The `Response` class instance.
- `content`: File content a vector of character string, content of the template.
- `ext`: File extension of the template file.

Include `...` in your hook to ensure it will handle potential updates to hooks in the future.

Details: Post render hook.

Returns: Invisible returns self.

Method `cookie()`**:**

Usage:

```
Response$cookie(
  name,
  value,
  expires = getOption("ambiorix.cookie.expire"),
  max_age = getOption("ambiorix.cookie.maxage"),
  domain = getOption("ambiorix.cookie.domain"),
  path = getOption("ambiorix.cookie.path", "/"),
  secure = getOption("ambiorix.cookie.secure", TRUE),
  http_only = getOption("ambiorix.cookie.httponly", TRUE),
  same_site = getOption("ambiorix.cookie.savesite")
)
```

Arguments:

`name` String. Name of the cookie.

`value` value of the cookie.

`expires` Expiry, if an integer assumes it's the number of seconds from now. Otherwise accepts an object of class `POSIXct` or `Date`. If a `character` string then it is set as-is and not pre-processed. If unspecified, the cookie becomes a session cookie. A session finishes when the client shuts down, after which the session cookie is removed.

`max_age` Indicates the number of seconds until the cookie expires. A zero or negative number will expire the cookie immediately. If both `expires` and `max_age` are set, the latter has precedence.

`domain` Defines the host to which the cookie will be sent. If omitted, this attribute defaults to the host of the current document URL, not including subdomains.

`path` Indicates the path that must exist in the requested URL for the browser to send the Cookie header.

`secure` Indicates that the cookie is sent to the server only when a request is made with the https: scheme (except on localhost), and therefore, is more resistant to man-in-the-middle attacks.

`http_only` Forbids JavaScript from accessing the cookie, for example, through the document.cookie property.

`same_site` Controls whether or not a cookie is sent with cross-origin requests, providing some protection against cross-site request forgery attacks (CSRF). Accepts `Strict`, `Lax`, or `None`.

Details: Set a cookie Overwrites existing cookie of the same `name`.

Returns: Invisibly returns self.

Method `clear_cookie()`**:**

Usage:

```
Response$clear_cookie(name)
```

Arguments:

`name` Name of the cookie to clear.

Details: Clear a cookie Clears the value of a cookie.

Returns: Invisibly returns self.

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Response$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
if (interactive()) {
  library(ambiorix)

  app <- Ambiorix$new()
```

```
  app$get("/", function(req, res) {
    # print(res)
    res$send("Using {ambiorix}!")
  })

  app$start()
}
```

`responses` *Plain Responses*

Description

Plain HTTP Responses.

Usage

```
response(body, headers = list(), status = 200L)

response_404(
  body = "404: Not found",
  headers = list(`Content-Type` = content_html()),
  status = 404L
)

response_500(
  body = "500: Server Error",
  headers = list(`Content-Type` = content_html()),
  status = 500L
)
```

Arguments

`body`	Body of response.
`headers`	HTTP headers.
`status`	Response status

Value

An Ambiorix response.

Examples

```
app <- Ambiorix$new()

# html
app$get("/", function(req, res){
 res$send("hello!")
```

```
})

# text
app$get("/text", function(req, res){
 res$text("hello!")
})

if(interactive())
 app$start()
```

---

robj *R Object*

Description

Treats a data element rendered in a response (`res$render`) as a data object and ultimately uses `dput()`.

Usage

```
robj(obj)
```

Arguments

`obj`	R object to treat.

Details

For instance in a template, `x <- [% var %]` will not work with `res$render(data=list(var = "hello"))` because this will be replace like `x <- hello` (missing quote): breaking the template. Using `robj` one would obtain `x <- "hello"`.

Value

Object of class "robj".

Examples

```
robj(1:10)
```

Router *Router*

Description

Web server.

Value

A Router object.

Super class

`ambiorix::Routing` -> `Router`

Public fields

`error` 500 response when the route errors, must a handler function that accepts the request and the response, by default uses `response_500()`.

Methods

Public methods:

- `Router$new()`
- `Router$print()`
- `Router$clone()`

Method `new()`:

Usage:

```
Router$new(path)
```

Arguments:

`path` The base path of the router.

Details: Define the base route.

Method `print()`:

Usage:

```
Router$print()
```

Details: Print

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```
Router$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
# log
logger <- new_log()
# router
# create router
router <- Router$new("/users")

router$get("/", function(req, res){
 res$send("List of users")
})

router$get("/:id", function(req, res){
 logger$log("Return user id:", req$params$id)
 res$send(req$params$id)
})

router$get("/:id/profile", function(req, res){
 msg <- sprintf("This is the profile of user #%s", req$params$id)
 res$send(msg)
})

# core app
app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Home!")
})

# mount the router
app$use(router)

if(interactive())
 app$start()
```

`Routing` *Core Routing Class*

Description

Core routing class. Do not use directly, see Ambiorix, and Router.

Value

A Routing object.

Public fields

`error` Error handler.

Active bindings

`basepath` Basepath, read-only.

`websocket` Websocket handler.

Methods

Public methods:

- `Routing$new()`
- `Routing$get()`
- `Routing$put()`
- `Routing$patch()`
- `Routing$delete()`
- `Routing$post()`
- `Routing$options()`
- `Routing$all()`
- `Routing$receive()`
- `Routing$print()`
- `Routing$engine()`
- `Routing$use()`
- `Routing$get_routes()`
- `Routing$get_receivers()`
- `Routing$get_middleware()`
- `Routing$prepare()`
- `Routing$clone()`

Method `new()`:

Usage:

```
Routing$new(path = "")
```

Arguments:

`path` Prefix path.

Details: Initialise

Method `get()`:

Usage:

```
Routing$get(path, handler, error = NULL)
```

Arguments:

`path` Route to listen to, `:` defines a parameter.

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

`error` Handler function to run on error.

Details: GET Method
Add routes to listen to.

Examples:

```
app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()
```

Method `put()`**:**

Usage:

```
Routing$put(path, handler, error = NULL)
```

Arguments:

`path` Route to listen to, `:` defines a parameter.

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

`error` Handler function to run on error.

Details: PUT Method
Add routes to listen to.

Method `patch()`**:**

Usage:

```
Routing$patch(path, handler, error = NULL)
```

Arguments:

`path` Route to listen to, `:` defines a parameter.

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

`error` Handler function to run on error.

Details: PATCH Method
Add routes to listen to.

Method `delete()`**:**

Usage:

```
Routing$delete(path, handler, error = NULL)
```

Arguments:

`path` Route to listen to, `:` defines a parameter.

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

`error` Handler function to run on error.

Details: DELETE Method
Add routes to listen to.

Method `post()`**:**

Usage:

```
Routing$post(path, handler, error = NULL)
```

Arguments:

`path` Route to listen to.

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

`error` Handler function to run on error.

Details: POST Method
Add routes to listen to.

Method `options()`**:**

Usage:

```
Routing$options(path, handler, error = NULL)
```

Arguments:

`path` Route to listen to.

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

`error` Handler function to run on error.

Details: OPTIONS Method
Add routes to listen to.

Method `all()`**:**

Usage:

```
Routing$all(path, handler, error = NULL)
```

Arguments:

`path` Route to listen to.

`handler` Function that accepts the request and returns an object describing an httpuv response, e.g.: `response()`.

`error` Handler function to run on error.

Details: All Methods
Add routes to listen to for all methods `GET`, `POST`, `PUT`, `DELETE`, and `PATCH`.

Method `receive()`**:**

Usage:

```
Routing$receive(name, handler)
```

Arguments:

`name` Name of message.

`handler` Function to run when message is received.

Details: Receive Websocket Message

Examples:

```
app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

app$receive("hello", function(msg, ws){
 print(msg) # print msg received

 # send a message back
 ws$send("hello", "Hello back! (sent from R)")
})

if(interactive())
 app$start()
```

Method `print()`**:**

Usage:

```
Routing$print()
```

Details: Print

Method `engine()`**:**

Usage:

```
Routing$engine(engine)
```

Arguments:

`engine` Engine function.

Details: Engine to use for rendering templates.

Method `use()`**:**

Usage:

```
Routing$use(use)
```

Arguments:

`use` Either a router as returned by Router, a function to use as middleware, or a `list` of functions. If a function is passed, it must accept two arguments (the request, and the response): this function will be executed every time the server receives a request. *Middleware may but does not have to return a response, unlike other methods such as* `get` Note that multiple routers and middlewares can be used.

Details: Use a router or middleware

Method `get_routes()`**:**

Usage:

```
Routing$get_routes(routes = list(), parent = "")
```

Arguments:

`routes` Existing list of routes.

`parent` Parent path.

Details: Get the routes

Method `get_receivers()`**:**

Usage:

```
Routing$get_receivers(receivers = list())
```

Arguments:

`receivers` Existing list of receivers

Details: Get the websocket receivers

Method `get_middleware()`**:**

Usage:

```
Routing$get_middleware(middlewares = list(), parent = "")
```

Arguments:

`middlewares` Existing list of middleswares

`parent` Parent path

Details: Get the middleware

Method `prepare()`**:**

Usage:

```
Routing$prepare()
```

Details: Prepare routes and decomposes paths

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Routing$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
## ------------------------------------------------
## Method `Routing$get`
## ------------------------------------------------

app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

if(interactive())
 app$start()

## ------------------------------------------------
```

```
## Method `Routing$receive`
## ------------------------------------------------

app <- Ambiorix$new()

app$get("/", function(req, res){
 res$send("Using {ambiorix}!")
})

app$receive("hello", function(msg, ws){
 print(msg) # print msg received

 # send a message back
 ws$send("hello", "Hello back! (sent from R)")
})

if(interactive())
 app$start()
```

`serialise` *Serialise an Object to JSON*

Description

Serialise an Object to JSON

Usage

```
serialise(data, ...)
```

Arguments

`data`	Data to serialise.
`...`	Passed to serialiser.

Details

Ambiorix uses `yyjsonr::write_json_str()` by default for serialization.

Custom Serialiser:

To override the default, set the `AMBIORIX_SERIALISER` option to a function that accepts:

- `data`: Object to serialise.
- `...`: Additional arguments passed to the function.

For example:

```
my_serialiser <- function(data, ...) {
 jsonlite::toJSON(x = data, ...)
}

options(AMBIORIX_SERIALISER = my_serialiser)
```

Value

JSON string.

Examples

```
if (interactive()) {
  # a list:
  response <- list(code = 200L, msg = "hello, world!")

  serialise(response)
  #> {"code":200,"msg":"hello, world"}

  serialise(response, auto_unbox = FALSE)
  #> {"code":[200],"msg":["hello, world"]}

  # data.frame:
  serialise(cars)
}
```

---

set_log *Customise logs*

Description

Customise the internal logs used by Ambiorix.

Usage

```
set_log_info(log)

set_log_success(log)

set_log_error(log)
```

Arguments

log	An object of class Logger, see log::Logger.

Value

The log object.

Examples

```
# define custom loggers:
info_logger <- log::Logger$new("INFO")
success_logger <- log::Logger$new("SUCCESS")
error_logger <- log::Logger$new("ERROR")

info_logger$log("This is an info message.")
success_logger$log("This is a success message.")
error_logger$log("This is an error message.")

# set custom loggers for Ambiorix:
set_log_info(info_logger)
set_log_success(success_logger)
set_log_error(error_logger)
```

---

stop_all *Stop*

Description

Stop all servers.

Usage

```
stop_all()
```

Value

`NULL` (invisibly)

Examples

```
if (interactive()) {
  stop_all()
}
```

---

token_create *Token*

Description

Create a token

Usage

```
token_create(n = 16L)
```

Arguments

n	Number of bytes.

Value

Length 1 character vector.

Examples

```
token_create()
token_create(n = 32L)
```

---

use_html_template *HTML Template*

Description

Use `htmltools::htmlTemplate()` as renderer. Passed to use method.

Usage

```
use_html_template()
```

Value

A renderer function.

Examples

```
use_html_template()
```

Websocket *Websocket*

Description

Handle websocket messages.

Value

A Websocket object.

Methods

Public methods:

- `Websocket$new()`
- `Websocket$send()`
- `Websocket$print()`
- `Websocket$clone()`

Method `new()`**:**

Usage:

```
Websocket$new(ws)
```

Arguments:

`ws`

Details: Constructor

Method `send()`**:**

Usage:

```
Websocket$send(name, message)
```

Arguments:

`name` Name, identifier, of the message.

`message` Content of the message, anything that can be serialised to JSON.

Details: Send a message

Method `print()`**:**

Usage:

```
Websocket$print()
```

Details: Print

Method `clone()`**:** The objects of this class are cloneable with this method.

Usage:

```
Websocket$clone(deep = FALSE)
```

Arguments:

`deep` Whether to make a deep clone.

Examples

```
# create an Ambiorix app with websocket support:
if (interactive()) {
  library(ambiorix)

  home_get <- function(req, res) {
    res$send("hello, world!")
  }

  greeting_ws_handler <- function(msg, ws) {
```

```
    cat("Received message:", "\n")
    print(msg)
    ws$send("greeting", "Hello from the server!")
  }

  app <- Ambiorix$new(port = 8080)
  app$get("/", home_get)
  app$receive("greeting", greeting_ws_handler)
  app$start()
}

# create websocket client from another R session:
if (interactive()) {
  client <- websocket::WebSocket$new("ws://127.0.0.1:8080", autoConnect = FALSE)

  client$onOpen(function(event) {
    cat("Connection opened\n")

    msg <- list(
      isAmbiorix = TRUE, # __MUST__ be set!
      name = "greeting",
      message = "Hello from the client!"
    )

    # serialise:
    msg <- yyjsonr::write_json_str(msg, auto_unbox = TRUE)

    client$send(msg)
  })

  client$onMessage(function(event) {
    cat("Received message from server:", event$data, "\n")
  })

  client$connect()
}
```

`websocket_client` *Websocket Client*

Description

Handle ambiorix websocket client.

Usage

```
copy_websocket_client(path)

get_websocket_client_path()
```

```
get_websocket_clients()
```

Arguments

path	Path to copy the file to.

Value

- copy_websocket_client: String. The new path (invisibly).
- get_websocket_client_path: String. The path to the local websocket client.
- get_websocket_clients: List. Websocket clients.

Functions

- copy_websocket_client Copies the websocket client file, useful when ambiorix was not setup with the ambiorix generator.
- get_websocket_client_path Retrieves the full path to the local websocket client.
- get_websocket_clients Retrieves clients connected to the server.

Examples

```
chat_ws <- function(msg, ws) {
  lapply(
    X = get_websocket_clients(),
    FUN = function(c) {
      c$send("chat", msg)
    }
  )
}
```
