Package: gendist (via r-universe)

September 17, 2024

Type Package

Title Generated Probability Distribution Models

Version 2.0

Date 2019-01-30

Author Shaiful Anuar Abu Bakar

Maintainer Shaiful Anuar Abu Bakar <saab@um.edu.my>

Description Computes the probability density function (pdf), cumulative distribution function (cdf), quantile function (qf) and generates random values (rg) for the following general models : mixture models, composite models, folded models, skewed symmetric models and arc tan models.

License GPL (>= 2)

`gendist-package` *Generated Probability Distribution Models*

Description

Computes the probability density function (pdf), cumulative distribution function (cdf), quantile function (qf) and generates random values (rg) for the following general models : mixture models, composite models, folded models, skewed symmetric models and arc tan models.

Details

Package:	gendist
Type:	Package
Version:	2.0
Date:	2019-01-30
License:	GPL (>=2)

All the models use parent distribution(s) and thus flexible to incorporate many exisiting probability distributions.

`darctan` *Probabilty density function of arc tan model.*

Description

Computes pdf of the arc tan model.

Usage

```
darctan(x, alpha, spec, arg, log = FALSE)
```

Arguments

`x`	scalar or vector of values to compute the pdf.
`alpha`	the value of α parameter, $\alpha > 0$.
`spec`	a character string specifying the parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
`arg`	list of arguments/parameters of the parent distribution.
`log`	logical; if `TRUE`, log(pdf) are returned.

Details

The pdf of arc tan model with parameter α has a general form of:

$$f(x) = \frac{1}{\arctan(\alpha)} \frac{\alpha g(x)}{1 + (\alpha(1 - G(x)))^2}$$

for $a \leq x \leq b$ where a and b follow the support of $g(x)$. $\arctan$ denote the inverse function of tangent. $g(x)$ and $G(x)$ are the pdf and cdf of parent distribution, respectively. Note also that $\alpha > 0$.

Value

An object of the same length as `x`, giving the pdf values computed at `x`.

Author(s)

Shaiful Anuar Abu Bakar

References

Abu Bakar, S. A., Nadarajah, S., Adzhar, Z. A. A. K., & Mohamed, I. (2016). gendist: An R package for generated probability distribution models. PloS one, 11(6).
Gomez-Deniz, E., & Calderin-Ojeda, E. Modelling insurance data with the pareto arctan distribution. ASTIN Bulletin, 1-22.

Examples

```
x=runif(10, min=0, max=1)
y=darctan(x, alpha=0.5, spec="lnorm", arg=list(meanlog=1,sdlog=2) )
```

`dcomposite` *Probabilty density function of composite model.*

Description

Computes pdf of the composite model.

Usage

```
dcomposite(x, spec1, arg1, spec2, arg2, initial = 1, log = FALSE)
```

Arguments

`x`	scalar or vector of values to compute the pdf.
`spec1`	a character string specifying the head parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
`arg1`	list of arguments/parameters of the head parent distribution.
`spec2`	a character string specifying the tail parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
`arg2`	list of arguments/parameters of the tail parent distribution.
`initial`	initial values of the threshold, θ.
`log`	logical; if `TRUE`, log(pdf) are returned.

Details

The pdf of composite model has a general form of:

$$f(x) = \frac{1}{1+\phi} f_1^*(x), \text{ if } \quad x \leq \theta,$$

$$= \frac{\phi}{1+\phi} f_2^*(x), \text{ if } \quad x > \theta,$$

whereby ϕ is the weight component, θ is the threshold and $f_i^*(x)$ for $i = 1, 2$ are the truncated pdfs correspond to head and tail parent distributions defined by

$$f_1^*(x) = \frac{f_1(x)}{F_1(\theta)}$$

and

$$f_2^*(x) = \frac{f_2(x)}{1 - F_2(\theta)}$$

respectively.

Value

An object of the same length as x, giving the pdf values computed at x.

Examples

```
x=runif(10, min=0, max=1)
y=dcomposite(x, spec1="lnorm", arg1=list(meanlog=0.1,sdlog=0.2), spec2="exp",
             arg2=list(rate=0.5) )
```

---

dfolded *Probabilty density function of folded model.*

Description

Computes pdf of the folded model.

Usage

```
dfolded(x, spec, arg, log = FALSE)
```

Arguments

x	scale or vector of values to compute the pdf.
spec	a character string specifying the parent distribution (for example, "norm" if the parent disstribution correspond to the normal).
arg	list of arguments/parameters of the parent distribution.
log	logical; if TRUE, log(pdf) are returned.

Details

The pdf of folded model has a general form of:

$$f(x) = g(x) + g(-x) \quad x > 0$$

where $G(x)$ is the cdf of parent distribution.

Value

An object of the same length as x, giving the pdf values computed at x.

Examples

```
x=runif(10, min=0, max=1)
y=dfolded(x, spec="norm", arg=list(mean=1,sd=2) )
```

---

dmixt *Probabilty density function of mixture model.*

Description

Computes pdf of the mixture model.

Usage

```
dmixt(x, phi, spec1, arg1, spec2, arg2, log = FALSE)
```

Arguments

x	scalar or vector of values to compute the pdf.
phi	the value of ϕ parameter, $\phi > 0$.
spec1	a character string specifying the first parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
arg1	list of arguments/parameters of the first parent distribution.
spec2	a character string specifying the second parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
arg2	list of arguments/parameters of the second parent distribution.
log	logical; if TRUE, log(pdf) are returned.

Details

The pdf of mixture model with parameter phi has a general form of:

$$f(x) = \frac{1}{1+\phi}\left(g_1(x) + \phi g_2(x)\right)$$

where x follows the support of parent distributions, ϕ is the weight component and $g_i(x)$ for $i = 1, 2$ are the pdfs of first and second parent distributions, respectively.

Value

An object of the same length as x, giving the pdf values computed at x.

Examples

```
x=runif(10, min=0, max=1)
y=dmixt(x, phi=0.5, spec1="lnorm", arg1=list(meanlog=1,sdlog=2), spec2="exp",
        arg2=list(rate=2) )
```

dskew *Probabilty density function of skewed symmetric model.*

Description

Computes pdf of the skewed symmetric model.

Usage

```
dskew(x, spec1, arg1, spec2, arg2, log = FALSE)
```

Arguments

x	scalar or vector of values to compute the pdf.
spec1	a character string specifying the parent distribution $g(x)$ (for example, "norm" if the parent distribution corresponds to the normal).
arg1	list of arguments/parameters of the parent distribution $g(x)$.
spec2	a character string specifying the parent distribution $H(x)$ (for example, "logis" if the parent distribution corresponds to the logistic).
arg2	list of arguments/parameters of the parent distribution $H(x)$.
log	logical; if TRUE, log(pdf) are returned.

Details

The pdf of skewed symmetric model has a general form of:

$$f(x) = 2h(x)G(x), \quad -\infty < x < \infty$$

where $h(x)$ and $G(x)$ are the pdf and cdf of parent distributions, respectively.

Value

An object of the same length as x, giving the pdf values computed at x.

Examples

```
x=runif(10, min=0, max=1)
y=dskew(x, spec1="norm", arg1=list(mean=0,sd=1), spec2="logis",
        arg2=list(location=0,scale=2) )
```

---

parctan *Cumulative distribution function of arc tan model.*

Description

Computes cdf of the arc tan model.

Usage

```
parctan(q, alpha, spec, arg, lower.tail = TRUE, log.p = FALSE)
```

Arguments

q	scalar or vector of values to compute the cdf.
alpha	the value of α parameter, $\alpha > 0$.
spec	a character string specifying the parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
arg	list of arguments/parameters of the parent distribution.
lower.tail	logical; if TRUE, cdf are returned, otherwise 1-cdf.
log.p	logical; if TRUE, probabilities returned are given as log(cdf).

Details

The cdf of arc tan model with parameter α has a general form of:

$$F(q) = 1 - \frac{\arctan(\alpha(1 - G(q)))}{\arctan(\alpha)}$$

for $a \leq x \leq b$ where a and b follow the support of $g(q)$. $\arctan$ denote the inverse function of tangent. $g(q)$ and $G(q)$ are the pdf and cdf of parent distribution, respectively. Note also that $\alpha > 0$.

Value

An object of the same length as q, giving the cdf values computed at q.

x=runif(10, min=0, max=1)
y=parctan(x, alpha=0.5, spec="lnorm", arg=list(meanlog=1,sdlog=2) )
```

`pcomposite` *Cumulative distribution function of composite model.*

Description

Computes cdf of the composite model.

Usage

```
pcomposite(q, spec1, arg1, spec2, arg2, initial = 1, lower.tail = TRUE, log.p = FALSE)
```

Arguments

`q`	scalar or vector of values to compute the cdf.
`spec1`	a character string specifying the head parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
`arg1`	list of arguments/parameters of the head parent distribution.
`spec2`	a character string specifying the tail parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
`arg2`	list of arguments/parameters of the tail parent distribution.
`initial`	initial values of the threshold, θ.
`lower.tail`	logical; if `TRUE`, cdf are returned, otherwise 1-cdf.
`log.p`	logical; if `TRUE`, probabilities returned are given as log(cdf).

Details

The cdf of composite model has a general form of:

$$F(x) = \frac{1}{1+\phi}\frac{F_1(x)}{F_1(\theta)} \text{ if } \quad x \leq \theta,$$

$$= \frac{1}{1+\phi}\left(1+\phi\frac{F_2(x)-F_2(\theta)}{1-F_2(\theta)}\right) \text{ if } \quad x > \theta,$$

whereby ϕ is the weight component, θ is the threshold and $F_i(x)$ for $i = 1, 2$ are the cdfs correspond to head and tail parent distributions, respectively.

Value

An object of the same length as q, giving the cdf values computed at q.

y=pcomposite(x, spec1="lnorm", arg1=list(meanlog=0.1,sdlog=0.2), spec2="exp",
             arg2=list(rate=0.5) )
```

---

pfolded *Cumulative distribution function of folded model.*

Description

Computes cdf of the folded model.

Usage

```
pfolded(q, spec, arg, lower.tail = TRUE, log.p = FALSE)
```

Arguments

q	scale or vector of values to compute the cdf.
spec	a character string specifying the parent distribution (for example, "norm" if the parent distribution correspond to the normal).
arg	list of arguments/parameters of the parent distribution.
lower.tail	logical; if TRUE, cdf are returned, otherwise 1-cdf.
log.p	logical; if TRUE, probabilities returned are given as log(cdf).

Details

The cdf of folded model has a general form of:

$$F(x) = G(x) - G(-x) \quad x > 0$$

where $G(x)$ is the cdf of parent distribution.

Value

An object of the same length as q, giving the cdf values computed at q.

```

---

pmixt *Cumulative distribution function of mixture model.*

Description

Computes cdf of the mixture model.

Usage

```
pmixt(q, phi, spec1, arg1, spec2, arg2, lower.tail = TRUE, log.p = FALSE)
```

Arguments

q	scalar or vector of values to compute the cdf.
phi	the value of ϕ parameter, $\phi > 0$.
spec1	a character string specifying the first parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
arg1	list of arguments/parameters of the first parent distribution.
spec2	a character string specifying the second parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
arg2	list of arguments/parameters of the second parent distribution.
lower.tail	logical; if TRUE, cdf are returned, otherwise 1-cdf.
log.p	logical; if TRUE, probabilities returned are given as log(cdf).

Details

The cdf of mixture model has a general form of:

$$F(x) = frac11 + \phi\left(G_1(x) + \phi G_2(x)\right)$$

where x follows the support of parent distributions, ϕ is the weight component and $G_i(x)$ for $i = 1, 2$ are the cdfs of first and second parent distributions, respectively.

Value

An object of the same length as q, giving the cdf values computed at q.

```

---

pskew *Cumulative distribution function of skewed symmetric model.*

Description

Computes cdf of the skewed symmetric model.

Usage

```
pskew(q, spec1, arg1, spec2, arg2, lower.tail = TRUE, log.p = FALSE)
```

Arguments

q	scale or vector of values to compute the cdf.
spec1	a character string specifying the parent distribution $g(x)$ (for example, "norm" if the parent distribution corresponds to the normal).
arg1	list of arguments/parameters of the parent distribution $g(x)$.
spec2	a character string specifying the parent distribution $H(x)$ (for example, "logis" if the parent distribution corresponds to the logistic).

arg2	list of arguments/parameters of the parent distribution $H(x)$.
lower.tail	logical; if TRUE, cdf are returned, otherwise 1-cdf.
log.p	logical; if TRUE, probabilities returned are given as log(cdf).

Details

The cdf of skewed symmetric model has a general form of:

$$F(x) = \int_{-\infty}^{x} 2h(y)G(y)dy, \quad -\infty < x < \infty$$

where $h(x)$ and $G(x)$ are the pdf and cdf of parent distributions, respectively.

Value

An object of the same length as q, giving the cdf values computed at q.

```

---

qarctan *Quantile function of arc tan model.*

Description

Computes qf of the arc tan model.

Usage

```
qarctan(p, alpha, spec, arg, lower.tail = TRUE, log.p = FALSE)
```

Arguments

p	scalar or vector of probabilities to compute the qf.
alpha	the value of α parameter, $\alpha > 0$.
spec	a character string specifying the parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
arg	list of arguments/parameters of the parent distribution.
lower.tail	logical; if TRUE, probabilities are p, otherwise 1-p.
log.p	logical; if TRUE, probabilities p are returned as log(p).

Details

The qf of arc tan model with parameter α has a general form of:

$$Q(p) = G^{-1}\left(1 - \frac{1}{\alpha}\tan((1-p)\arctan(\alpha))\right)$$

for $a \leq x \leq b$ where a and b follow the support of $G(x)$. $\arctan$ denote the inverse function of tangent and G^{-1} is the inverse cdf of parent distribution, respectively. Note also that $\alpha > 0$.

Value

An object of the same length as p, giving the qf values computed at p.

Author(s)

Shaiful Anuar Abu Bakar

Examples

```
x=runif(10, min=0, max=1)
y=qarctan(x, alpha=0.5, spec="lnorm", arg=list(meanlog=1,sdlog=2) )
```

qcomposite *Quantile function of composite model.*

Description

Computes qf of the composite model.

Usage

```
qcomposite(p, spec1, arg1, spec2, arg2, initial = 1, lower.tail = TRUE, log.p = FALSE)
```

Arguments

p	scalar or vector of probabilities to compute the qf.
spec1	a character string specifying the head parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
arg1	list of arguments/parameters of the head parent distribution.
spec2	a character string specifying the tail parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
arg2	list of arguments/parameters of the tail parent distribution.
initial	initial values of the threshold, θ.
lower.tail	logical; if TRUE, probabilities are p, otherwise 1-p.
log.p	logical; if TRUE, probabilities p are returned as log(p).

Details

The qf of composite model has a general form of:

$$Q(p) = Q_1(p(1+\phi)F_1(\theta)) \text{ if } \quad p \leq \frac{1}{1+\phi},$$

$$= Q_2\left(F_2(\theta) + (1-F_2(\theta))\left(\frac{p(1+\phi)-1}{\phi}\right)\right) \text{ if } \quad p > \frac{1}{1+\phi}$$

whereby ϕ is the weight component, θ is the threshold and $F_i(x)$ for $i = 1, 2$ are the qfs correspond to head and tail parent distributions, respectively.

Value

An object of the same length as p, giving the qf values computed at p.

```
x=runif(10, min=0, max=1)
y=qcomposite(x, spec1="lnorm", arg1=list(meanlog=0.1,sdlog=0.2), spec2="exp",
             arg2=list(rate=0.5) )
```

`qfolded` *Quantile function of folded model.*

Description

Computes cdf of the folded model.

Usage

```
qfolded(p, spec, arg, interval = c(0, 100), lower.tail = TRUE, log.p = FALSE)
```

Arguments

`p`	scalar or vector of probabilities to compute the qf.
`spec`	a character string specifying the parent distribution (for example, "norm" if the parent distribution correspond to the normal).
`arg`	list of arguments/parameters of the parent distribution.
`interval`	a vector of interval end-points for `p` to search for the function root.
`lower.tail`	logical; if `TRUE`, probabilities are `p`, otherwise 1-`p`.
`log.p`	logical; if `TRUE`, probabilities `p` are returned as log(`p`).

Value

An object of the same length as `p`, giving the qf values computed at `p`.

```

`qmixt` *Quantile function of mixture model.*

Description

Computes qf of the mixture model.

Usage

```
qmixt(p, phi, spec1, arg1, spec2, arg2, interval = c(0, 100),
      lower.tail = TRUE, log.p = FALSE)
```

Arguments

`p`	scalar or vector of probabilities to compute the qf.
`phi`	the value of ϕ parameter, $\phi > 0$.
`spec1`	a character string specifying the first parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
`arg1`	list of arguments/parameters of the first parent distribution.
`spec2`	a character string specifying the second parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
`arg2`	list of arguments/parameters of the second parent distribution.
`interval`	a vector of interval end-points for `p` to search for the function root.
`lower.tail`	logical; if `TRUE`, probabilities are `p`, otherwise 1-`p`.
`log.p`	logical; if `TRUE`, probabilities `p` are returned as log(`p`).

Value

An object of the same length as `p`, giving the qf values computed at `p`.

References

Pearson, K. (1894). Contributions to the mathematical theory of evolution. Philosophical Transactions of the Royal Society of London. A, 71-110.

Examples

```
x=runif(10, min=0, max=1)
y=qmixt(x, phi=0.5, spec1="lnorm", arg1=list(meanlog=0.1,sdlog=0.2), spec2="exp",
        arg2=list(rate=0.5))
```

---

qskew *Quantile function of skewed symmetric model.*

Description

Computes qf of the skewed symmetric model.

Usage

```
qskew(p, spec1, arg1, spec2, arg2, interval = c(1, 10), lower.tail = TRUE, log.p = FALSE)
```

Arguments

p	scalar or vector of probabilities to compute the qf.
spec1	a character string specifying the parent distribution $g(x)$ (for example, "norm" if the parent distribution corresponds to the normal).
arg1	list of arguments/parameters of the parent distribution $g(x)$.
spec2	a character string specifying the parent distribution $H(x)$ (for example, "logis" if the parent distribution corresponds to the logistic).
arg2	list of arguments/parameters of the parent distribution $H(x)$.
interval	a vector of interval end-points for p to search for the function root.
lower.tail	logical; if TRUE, probabilities are p, otherwise 1-p.
log.p	logical; if TRUE, probabilities p are returned as log(p).

Value

An object of the same length as p, giving the qf values computed at p.

Azzalini, A. (1985). A class of distributions which includes the normal ones. Scandinavian journal of statistics, 171-178.

Examples

```
x=runif(10, min=0, max=1)
y=qskew(x, spec1="norm", arg1=list(mean=0,sd=0.1), spec2="logis",
        arg2=list(location=0,scale=0.2))
```

`rarctan` *Random generation of arc tan model.*

Description

Computes rg of the arc tan model.

Usage

```
rarctan(n, alpha, spec, arg)
```

Arguments

`n`	number of random generated values.
`alpha`	the value of α parameter, $\alpha > 0$.
`spec`	a character string specifying the parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
`arg`	list of arguments/parameters of the parent distribution.

Examples

```
y=rarctan(10, alpha=0.5, spec="lnorm", arg=c(meanlog=1,sdlog=2) )
```

`rcomposite` *Random generation of composite model.*

Description

Computes rg of the composite model.

Usage

```
rcomposite(n, spec1, arg1, spec2, arg2, initial = 1)
```

Arguments

`n`	number of random generated values.
`spec1`	a character string specifying the head parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
`arg1`	list of arguments/parameters of the head parent distribution.
`spec2`	a character string specifying the tail parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
`arg2`	list of arguments/parameters of the tail parent distribution.
`initial`	initial values of the threshold, θ.

Value

An object of the length `n`, giving the random generated values for the composite model.

y=rcomposite(10, spec1="lnorm", arg1=list(meanlog=0.1,sdlog=0.2), spec2="exp",
             arg2=list(rate=0.5))
```

rfolded *Random generation of folded model.*

Description

Computes rg of the folded model.

Usage

```
rfolded(n, spec, arg, interval = c(0, 100))
```

Arguments

n	number of random generated values.
spec	a character string specifying the parent distribution (for example, "norm" if the parent distribution correspond to the normal).
arg	list of arguments/parameters of the parent distribution.
interval	a vector of interval end-points to search function root.

Value

An object of the length n, giving the random generated values for the folded model.

y=rfolded(10, spec="norm", arg=list(mean=1,sd=2), interval=c(0,100) )
```

rmixt *Random generation of mixture model.*

Description

Computes rg of the mixture model.

Usage

```
rmixt(n, phi, spec1, arg1, spec2, arg2, interval = c(0, 100))
```

Arguments

n	number of random generated values.
phi	the value of ϕ parameter, $\phi > 0$.
spec1	a character string specifying the first parent distribution (for example, "lnorm" if the parent distribution corresponds to the lognormal).
arg1	list of arguments/parameters of the first parent distribution.
spec2	a character string specifying the second parent distribution (for example, "exp" if the parent distribution corresponds to the exponential).
arg2	list of arguments/parameters of the second parent distribution.
interval	a vector of interval end-points to search function root.

Value

An object of the length n, giving the random generated values for the mixture model.

rskew *Random generation of skewed symmetric model.*

Description

Computes rg of the skewed symmetric model.

Usage

```
rskew(n, spec1, arg1, spec2, arg2, interval = c(1, 10))
```

Arguments

n	number of random generated values.
spec1	a character string specifying the parent distribution $g(x)$ (for example, "norm" if the parent distribution corresponds to the normal).
arg1	list of arguments/parameters of the parent distribution $g(x)$.
spec2	a character string specifying the parent distribution $H(x)$ (for example, "logis" if the parent distribution corresponds to the logistic).
arg2	list of arguments/parameters of the parent distribution $H(x)$.
interval	a vector of interval end-points to search function root.

Value

An object of the length n, giving the random generated values for the skewed symmetric model.
