

# Package: heimdall (via r-universe)

September 29, 2024

**Title** Drift Adaptable Models

**Version** 1.0.717

**Description** By analyzing streaming datasets, it is possible to observe significant changes in the data distribution or models' accuracy during their prediction (concept drift). The goal of 'heimdall' is to measure when concept drift occurs. The package makes available several state-of-the-art methods. It also tackles how to adapt models in a nonstationary context. Some concept drifts methods are described in Tavares (2022) [doi:10.1007/s12530-021-09415-z](https://doi.org/10.1007/s12530-021-09415-z).

**License** MIT + file LICENSE

dfr_adwin	<i>ADWIN method</i>
-----------	---------------------

---

Description

Adaptive Windowing method for concept drift detection [doi:10.1137/1.9781611972771.42](https://doi.org/10.1137/1.9781611972771.42).

Usage

```
dfr_adwin(target_feat, delta = 0.002)
```

Arguments

- target\_feat      Feature to be monitored.
- delta            The significance parameter for the ADWIN algorithm.

Value

dfr\_adwin object

**Examples**

```
#Use the same example of dfr_cumsum changing the constructor to:
#model <- dfr_adwin(target_feat='serie')
```

dfr\_cusum

*Cumulative Sum for Concept Drift Detection (CUMSUM) method***Description**

The cumulative sum (CUSUM) is a sequential analysis technique used for change detection.

**Usage**

```
dfr_cusum(lambda = 100)
```

**Arguments**

lambda                      Necessary level for warning zone (2 standard deviation)

**Value**

dfr\_cusum object

**Examples**

```
library(daltoolbox)
library(heimdall)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_cusum()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}
```

```
}
detection[detection$type == 'drift',]
```

---

dfr\_ddm

---

*Adapted Drift Detection Method (DDM) method*

---

## Description

DDM is a concept change detection method based on the PAC learning model premise, that the learner's error rate will decrease as the number of analysed samples increase, as long as the data distribution is stationary. [doi:10.1007/978-3-540-28645-5\\_29](https://doi.org/10.1007/978-3-540-28645-5_29).

## Usage

```
dfr_ddm(min_instances = 30, warning_level = 2, out_control_level = 3)
```

## Arguments

min\_instances    The minimum number of instances before detecting change  
warning\_level    Necessary level for warning zone (2 standard deviation)  
out\_control\_level    Necessary level for a positive drift detection

## Value

dfr\_ddm object

## Examples

```
library(daltoolbox)
library(heidmoll)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_ddm()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'
```

```

        output$obj <- reset_state(output$obj)
      }else{
        type <- ''
      }
      detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
    }

    detection[detection$type == 'drift',]

```

---

dfr\_ecdd

---

*Adapted EWMA for Concept Drift Detection (ECDD) method*

---

## Description

ECDD is a concept change detection method that uses an exponentially weighted moving average (EWMA) chart to monitor the misclassification rate of an streaming classifier.

## Usage

```
dfr_ecdd(lambda = 0.2, min_run_instances = 30, average_run_length = 100)
```

## Arguments

lambda	The minimum number of instances before detecting change
min_run_instances	
	Necessary level for warning zone (2 standard deviation)
average_run_length	
	Necessary level for a positive drift detection

## Value

dfr\_ecdd object

## Examples

```

library(daltoolbox)
library(heimdall)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_ecdd()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){

```

```

output <- update_state(output$obj, data$serie[i])
if (output$drift){
  type <- 'drift'
  output$obj <- reset_state(output$obj)
}else{
  type <- ''
}
detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

---

dfr\_eddm

---

*Adapted Early Drift Detection Method (EDDM) method*

---

## Description

EDDM (Early Drift Detection Method) aims to improve the detection rate of gradual concept drift in DDM, while keeping a good performance against abrupt concept drift. [doi: 2747577a61c70bc3874380130615e15aff76339](https://doi.org/10.2747577a61c70bc3874380130615e15aff76339)

## Usage

```

dfr_eddm(
  min_instances = 30,
  min_num_errors = 30,
  warning_level = 0.95,
  out_control_level = 0.9
)

```

## Arguments

`min_instances` The minimum number of instances before detecting change  
`min_num_errors` The minimum number of errors before detecting change  
`warning_level` Necessary level for warning zone  
`out_control_level` Necessary level for a positive drift detection

## Value

dfr\_eddm object

## Examples

```

library(daltoolbox)
library(heimdall)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

```

```

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_eddm()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

---

dfr\_hddm

---

*Adapted Hoeffding Drift Detection Method (HDDM) method*

---

## Description

is a drift detection method based on the Hoeffding's inequality. HDDM\_A uses the average as estimator. [doi:10.1109/TKDE.2014.2345382](https://doi.org/10.1109/TKDE.2014.2345382).

## Usage

```

dfr_hddm(
  drift_confidence = 0.001,
  warning_confidence = 0.005,
  two_side_option = TRUE
)

```

## Arguments

drift_confidence	Confidence to the drift
warning_confidence	Confidence to the warning
two_side_option	Option to monitor error increments and decrements (two-sided) or only increments (one-sided)

**Value**

dfr\_hddm object

**Examples**

```
library(daltoolbox)
library(heimdall)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_hddm()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]
```

---

dfr\_inactive

*Inactive dummy detector*

---

**Description**

Implements Inactive Dummy Detector

**Usage**

```
dfr_inactive()
```

**Value**

Drifter object

**Examples**

```
# See ?hcd_ddm for an example of DDM drift detector
```

---

dfr\_kldist

*KL Distance method*

---

**Description**

Kullback Leibler Windowing method for concept drift detection.

**Usage**

```
dfr_kldist(target_feat, window_size = 100, p_th = 0.9, data = NULL)
```

**Arguments**

target_feat	Feature to be monitored.
window_size	Size of the sliding window (must be $> 2 \times \text{stat\_size}$ )
p_th	Probability threshold for the test statistic of the Kullback Leibler distance.
data	Already collected data to avoid cold start.

**Value**

dfr\_kldist object

**Examples**

```
library(daltoolbox)
library(heimdall)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_kldist(target_feat='serie')

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
}
```

```

detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr\_kswin

*KSWIN method*

## Description

Kolmogorov-Smirnov Windowing method for concept drift detection [doi:10.1016/j.neucom.2019.11.111](https://doi.org/10.1016/j.neucom.2019.11.111).

## Usage

```

dfr_kswin(
  target_feat,
  window_size = 100,
  stat_size = 30,
  alpha = 0.005,
  data = NULL
)

```

## Arguments

target_feat	Feature to be monitored.
window_size	Size of the sliding window (must be > 2*stat_size)
stat_size	Size of the statistic window
alpha	Probability for the test statistic of the Kolmogorov-Smirnov-Test The alpha parameter is very sensitive, therefore should be set below 0.01.
data	Already collected data to avoid cold start.

## Value

dfr\_kswin object

## Examples

```

library(daltoolbox)
library(heidall)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_kswin(target_feat='serie')

```

```

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr\_mcdd

*Mean Comparison Distance method***Description**

Mean Comparison statistical method for concept drift detection.

**Usage**

```
dfr_mcdd(target_feat, alpha = 0.05, window_size = 100)
```

**Arguments**

target_feat	Feature to be monitored
alpha	Probability threshold for all test statistics
window_size	Size of the sliding window

**Value**

dfr\_mcdd object

**Examples**

```

library(daltoolbox)
library(heidall)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_mcdd(target_feat='depart_visibility')

```

```

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

---

dfr\_page\_hinkley

*Adapted Page Hinkley method*

---

## Description

Change-point detection method works by computing the observed values and their mean up to the current moment [doi:10.2307/2333009](https://doi.org/10.2307/2333009).

## Usage

```

dfr_page_hinkley(
  target_feat,
  min_instances = 30,
  delta = 0.005,
  threshold = 50,
  alpha = 1 - 1e-04
)

```

## Arguments

target_feat	Feature to be monitored.
min_instances	The minimum number of instances before detecting change
delta	The delta factor for the Page Hinkley test
threshold	The change detection threshold (lambda)
alpha	The forgetting factor, used to weight the observed value and the mean

## Value

dfr\_page\_hinkley object

**Examples**

```

library(daltoolbox)
library(heidmull)

# This example assumes a model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_page_hinkley(target_feat='serie')

detection <- c()
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, list(idx=i, event=output$drift, type=type))
}

detection <- as.data.frame(detection)
detection[detection$type == 'drift',]

```

dfr\_passive

*Passive dummy detector***Description**

Implements Passive Dummy Detector

**Usage**

```
dfr_passive()
```

**Value**

Drifter object

**Examples**

```
# See ?hcd_ddm for an example of DDM drift detector
```

---

dist_based	<i>Distribution Based Drifter sub-class</i>
------------	---

---

**Description**

Implements Distribution Based drift detectors

**Usage**

dist\_based(target\_feat)

**Arguments**

target\_feat      Feature to be monitored.

**Value**

Drifter object

---

drifter	<i>Drifter</i>
---------	----------------

---

**Description**

Ancestor class for drift detection

**Usage**

drifter()

**Value**

Drifter object

**Examples**

```
# See ?dd_ddm for an example of DDM drift detector
```

---

error_based	<i>Error Based Drifter sub-class</i>
-------------	--------------------------------------

---

**Description**

Implements Error Based drift detectors

**Usage**

```
error_based()
```

**Value**

Drifter object

**Examples**

```
# See ?hcd_ddm for an example of DDM drift detector
```

---

fit.drifter	<i>Process Batch</i>
-------------	----------------------

---

**Description**

Process Batch

**Usage**

```
## S3 method for class 'drifter'  
fit(obj, data, prediction, ...)
```

**Arguments**

obj	Drifter object
data	data batch in data frame format
prediction	prediction batch as vector format
...	optional arguments

**Value**

updated Drifter object

---

metric	<i>Metric</i>
--------	---------------

---

**Description**

Ancestor class for metric calculation

**Usage**

metric()

**Value**

Metric object

**Examples**

# See ?metric for an example of DDM drift detector

---

mt_fscore	<i>FScore Calculator</i>
-----------	--------------------------

---

**Description**

Class for FScore calculation

**Usage**

mt\_fscore(f = 1)

**Arguments**

f                      The F parameter for the F-Score metric

**Value**

Metric object

**Examples**

# See ?mt\_precision for an example of FScore Calculator

---

`mt_precision`*Precision Calculator*

---

**Description**

Class for precision calculation

**Usage**

```
mt_precision()
```

**Value**

Metric object

**Examples**

```
# See ?mt_precision for an example of Precision Calculator
```

---

`mt_recall`*Recall Calculator*

---

**Description**

Class for recall calculation

**Usage**

```
mt_recall()
```

**Value**

Metric object

**Examples**

```
# See ?mt_recall for an example of Recall Calculator
```

---

multi_criteria	<i>Multi Criteria Drifter sub-class</i>
----------------	---

---

**Description**

Implements Multi Criteria drift detectors

**Usage**

multi\_criteria()

**Value**

Drifter object

---

reset_state	<i>Reset State</i>
-------------	--------------------

---

**Description**

Reset Drifter State

**Usage**

reset\_state(obj)

**Arguments**

obj                      Drifter object

**Value**

updated Drifter object

**Examples**

# See ?hcd\_ddm for an example of DDM drift detector

---

stealthy

*Stealthy*

---

**Description**

Ancestor class for drift adaptive models

**Usage**

```
stealthy(model, drift_method, th = 0.5, verbose = FALSE)
```

**Arguments**

model	The algorithm object to be used for predictions
drift_method	The algorithm object to detect drifts
th	The threshold to be used with classification algorithms
verbose	if TRUE shows drift messages

**Value**

Stealthy object

**Examples**

```
# See ?dd_ddm for an example of DDM drift detector
```

---

st\_drift\_examples

*Synthetic time series for concept drift detection*

---

**Description**

A list of multivariate time series for drift detection

- example1: a bivariate dataset with one multivariate concept drift example

```
#'
```

**Usage**

```
data(st_drift_examples)
```

**Format**

A list of time series.

**Source**

Stealthy package

**References**

Stealthy package

**Examples**

```
data(st_drift_examples)
dataset <- st_drift_examples$example1
```

---

update_state	<i>Update State</i>
--------------	---------------------

---

**Description**

Update Drifter State

**Usage**

```
update_state(obj, value)
```

**Arguments**

- obj                      Drifter object
- value                    a value that represents a processed batch

**Value**

updated Drifter object

**Examples**

```
# See ?hcd_ddm for an example of DDM drift detector
```
