

Package: heimdall (via r-universe)

July 1, 2024

Title Drift Adaptable Models

Version 1.0.717

Description By analyzing streaming datasets, it is possible to observe significant changes in the data distribution or models' accuracy during their prediction (concept drift). The goal of 'heimdall' is to measure when concept drift occurs. The package makes available several state-of-the-art methods. It also tackles how to adapt models in a nonstationary context. Some concept drifts methods are described in Tavares (2022) [doi:10.1007/s12530-021-09415-z](https://doi.org/10.1007/s12530-021-09415-z).

dfr_adwin	<i>ADWIN method</i>
-----------	---------------------

Description

Adaptive Windowing method for concept drift detection [doi:10.1137/1.9781611972771.42](https://doi.org/10.1137/1.9781611972771.42).

Usage

```
dfr_adwin(target_feat, delta = 0.002)
```

Arguments

target_feat	Feature to be monitored.
delta	The significance parameter for the ADWIN algorithm.

Value

dfr_adwin object

Examples

```
#Use the same example of dfr_cumsum changing the constructor to:
#model <- dfr_adwin(target_feat='serie')
```

dfr_cusum	<i>Cumulative Sum for Concept Drift Detection (CUSUM) method</i>
-----------	--

Description

The cumulative sum (CUSUM) is a sequential analysis technique used for change detection.

Usage

```
dfr_cusum(lambda = 100)
```

Arguments

lambda Necessary level for warning zone (2 standard deviation)

Value

dfr_cusum object

Examples

```
library(daltoolbox)
library(heidmull)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_cusum()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}
```

```

}
detection[detection$type == 'drift',]

```

dfr_ddm

Adapted Drift Detection Method (DDM) method

Description

DDM is a concept change detection method based on the PAC learning model premise, that the learner's error rate will decrease as the number of analysed samples increase, as long as the data distribution is stationary. [doi:10.1007/978-3-540-28645-5_29](https://doi.org/10.1007/978-3-540-28645-5_29).

Usage

```
dfr_ddm(min_instances = 30, warning_level = 2, out_control_level = 3)
```

Arguments

min_instances The minimum number of instances before detecting change
warning_level Necessary level for warning zone (2 standard deviation)
out_control_level Necessary level for a positive drift detection

Value

dfr_ddm object

Examples

```

library(daltoolbox)
library(heimdall)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_ddm()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'

```

```

    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr_ecdd

Adapted EWMA for Concept Drift Detection (ECDD) method

Description

ECDD is a concept change detection method that uses an exponentially weighted moving average (EWMA) chart to monitor the misclassification rate of an streaming classifier.

Usage

```
dfr_ecdd(lambda = 0.2, min_run_instances = 30, average_run_length = 100)
```

Arguments

lambda	The minimum number of instances before detecting change
min_run_instances	Necessary level for warning zone (2 standard deviation)
average_run_length	Necessary level for a positive drift detection

Value

dfr_ecdd object

Examples

```

library(daltoolbox)
library(heidall)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_ecdd()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){

```

```

output <- update_state(output$obj, data$serie[i])
if (output$drift){
  type <- 'drift'
  output$obj <- reset_state(output$obj)
}else{
  type <- ''
}
detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr_eddm

Adapted Early Drift Detection Method (EDDM) method

Description

EDDM (Early Drift Detection Method) aims to improve the detection rate of gradual concept drift in DDM, while keeping a good performance against abrupt concept drift. [doi: 2747577a61c70bc3874380130615e15aff76339](https://doi.org/10.2747577a61c70bc3874380130615e15aff76339)

Usage

```

dfr_eddm(
  min_instances = 30,
  min_num_errors = 30,
  warning_level = 0.95,
  out_control_level = 0.9
)

```

Arguments

`min_instances` The minimum number of instances before detecting change
`min_num_errors` The minimum number of errors before detecting change
`warning_level` Necessary level for warning zone
`out_control_level`
 Necessary level for a positive drift detection

Value

dfr_eddm object

Examples

```

library(daltoolbox)
library(heimdall)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

```

```

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_eddm()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr_hddm

Adapted Hoeffding Drift Detection Method (HDDM) method

Description

is a drift detection method based on the Hoeffding's inequality. HDDM_A uses the average as estimator. [doi:10.1109/TKDE.2014.2345382](https://doi.org/10.1109/TKDE.2014.2345382).

Usage

```

dfr_hddm(
  drift_confidence = 0.001,
  warning_confidence = 0.005,
  two_side_option = TRUE
)

```

Arguments

drift_confidence
Confidence to the drift

warning_confidence
Confidence to the warning

two_side_option
Option to monitor error increments and decrements (two-sided) or only increments (one-sided)

Value

dfr_hddm object

Examples

```
library(daltoolbox)
library(heimdall)

# This example uses an error-based drift detector with a synthetic a
# model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_hddm()

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$prediction)){
  output <- update_state(output$obj, data$prediction[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]
```

dfr_inactive

Inactive dummy detector

Description

Implements Inactive Dummy Detector

Usage

```
dfr_inactive()
```

Value

Drifter object

Examples

```
# See ?hcd_ddm for an example of DDM drift detector
```

dfr_kldist	<i>KL Distance method</i>
------------	---------------------------

Description

Kullback Leibler Windowing method for concept drift detection.

Usage

```
dfr_kldist(target_feat, window_size = 100, p_th = 0.9, data = NULL)
```

Arguments

target_feat	Feature to be monitored.
window_size	Size of the sliding window (must be > 2*stat_size)
p_th	Probability threshold for the test statistic of the Kullback Leibler distance.
data	Already collected data to avoid cold start.

Value

dfr_kldist object

Examples

```
library(daltoolbox)
library(heidmull)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_kldist(target_feat='serie')

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
}
```

```

  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr_kswin

KSWIN method

Description

Kolmogorov-Smirnov Windowing method for concept drift detection [doi:10.1016/j.neucom.2019.11.111](https://doi.org/10.1016/j.neucom.2019.11.111).

Usage

```

dfr_kswin(
  target_feat,
  window_size = 100,
  stat_size = 30,
  alpha = 0.005,
  data = NULL
)

```

Arguments

target_feat	Feature to be monitored.
window_size	Size of the sliding window (must be > 2*stat_size)
stat_size	Size of the statistic window
alpha	Probability for the test statistic of the Kolmogorov-Smirnov-Test The alpha parameter is very sensitive, therefore should be set below 0.01.
data	Already collected data to avoid cold start.

Value

dfr_kswin object

Examples

```

library(daltoolbox)
library(heidall)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_kswin(target_feat='serie')

```

```

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr_mcdd

Mean Comparison Distance method

Description

Mean Comparison statistical method for concept drift detection.

Usage

```
dfr_mcdd(target_feat, alpha = 0.05, window_size = 100)
```

Arguments

target_feat	Feature to be monitored
alpha	Probability threshold for all test statistics
window_size	Size of the sliding window

Value

dfr_mcdd object

Examples

```

library(daltoolbox)
library(heidall)

# This example uses a dist-based drift detector with a synthetic dataset.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL

model <- dfr_mcdd(target_feat='depart_visibility')

```

```

detection <- NULL
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, data.frame(idx=i, event=output$drift, type=type))
}

detection[detection$type == 'drift',]

```

dfr_page_hinkley

Adapted Page Hinkley method

Description

Change-point detection method works by computing the observed values and their mean up to the current moment [doi:10.2307/2333009](https://doi.org/10.2307/2333009).

Usage

```

dfr_page_hinkley(
  target_feat,
  min_instances = 30,
  delta = 0.005,
  threshold = 50,
  alpha = 1 - 1e-04
)

```

Arguments

target_feat	Feature to be monitored.
min_instances	The minimum number of instances before detecting change
delta	The delta factor for the Page Hinkley test
threshold	The change detection threshold (lambda)
alpha	The forgetting factor, used to weight the observed value and the mean

Value

dfr_page_hinkley object

Examples

```
library(daltoolbox)
library(heimdall)

# This example assumes a model residual where 1 is an error and 0 is a correct prediction.

data(st_drift_examples)
data <- st_drift_examples$univariate
data$event <- NULL
data$prediction <- st_drift_examples$univariate$serie > 4

model <- dfr_page_hinkley(target_feat='serie')

detection <- c()
output <- list(obj=model, drift=FALSE)
for (i in 1:length(data$serie)){
  output <- update_state(output$obj, data$serie[i])
  if (output$drift){
    type <- 'drift'
    output$obj <- reset_state(output$obj)
  }else{
    type <- ''
  }
  detection <- rbind(detection, list(idx=i, event=output$drift, type=type))
}

detection <- as.data.frame(detection)
detection[detection$type == 'drift',]
```

dfr_passive

Passive dummy detector

Description

Implements Passive Dummy Detector

Usage

```
dfr_passive()
```

Value

Drifter object

Examples

```
# See ?hcd_ddm for an example of DDM drift detector
```

dist_based	<i>Distribution Based Drifter sub-class</i>
------------	---

Description

Implements Distribution Based drift detectors

Usage

```
dist_based(target_feat)
```

Arguments

target_feat Feature to be monitored.

Value

Drifter object

drifter	<i>Drifter</i>
---------	----------------

Description

Ancestor class for drift detection

Usage

```
drifter()
```

Value

Drifter object

Examples

```
# See ?dd_ddm for an example of DDM drift detector
```

error_based	<i>Error Based Drifter sub-class</i>
-------------	--------------------------------------

Description

Implements Error Based drift detectors

Usage

```
error_based()
```

Value

Drifter object

Examples

```
# See ?hcd_ddm for an example of DDM drift detector
```

fit.drifter	<i>Process Batch</i>
-------------	----------------------

Description

Process Batch

Usage

```
## S3 method for class 'drifter'
fit(obj, data, prediction, ...)
```

Arguments

obj	Drifter object
data	data batch in data frame format
prediction	prediction batch as vector format
...	optional arguments

Value

updated Drifter object

metric *Metric*

Description

Ancestor class for metric calculation

Usage

```
metric()
```

Value

Metric object

Examples

```
# See ?metric for an example of DDM drift detector
```

mt_fscore *FScore Calculator*

Description

Class for FScore calculation

Usage

```
mt_fscore(f = 1)
```

Arguments

f The F parameter for the F-Score metric

Value

Metric object

Examples

```
# See ?mt_precision for an example of FScore Calculator
```

mt_precision

Precision Calculator

Description

Class for precision calculation

Usage

mt_precision()

Value

Metric object

Examples

```
# See ?mt_precision for an example of Precision Calculator
```

mt_recall

Recall Calculator

Description

Class for recall calculation

Usage

mt_recall()

Value

Metric object

Examples

```
# See ?mt_recall for an example of Recall Calculator
```

multi_criteria	<i>Multi Criteria Drifter sub-class</i>
----------------	---

Description

Implements Multi Criteria drift detectors

Usage

```
multi_criteria()
```

Value

Drifter object

reset_state	<i>Reset State</i>
-------------	--------------------

Description

Reset Drifter State

Usage

```
reset_state(obj)
```

Arguments

obj	Drifter object
-----	----------------

Value

updated Drifter object

Examples

```
# See ?hcd_ddm for an example of DDM drift detector
```

stealthy	<i>Stealthy</i>
----------	-----------------

Description

Ancestor class for drift adaptive models

Usage

```
stealthy(model, drift_method, th = 0.5, verbose = FALSE)
```

Arguments

model	The algorithm object to be used for predictions
drift_method	The algorithm object to detect drifts
th	The threshold to be used with classification algorithms
verbose	if TRUE shows drift messages

Value

Stealthy object

Examples

```
# See ?dd_ddm for an example of DDM drift detector
```

st_drift_examples	<i>Synthetic time series for concept drift detection</i>
-------------------	--

Description

A list of multivariate time series for drift detection

- example1: a bivariate dataset with one multivariate concept drift example

```
#'
```

Usage

```
data(st_drift_examples)
```

Format

A list of time series.

Source

Stealthy package

References

Stealthy package

Examples

```
data(st_drift_examples)
dataset <- st_drift_examples$example1
```

update_state	<i>Update State</i>
--------------	---------------------

Description

Update Drifter State

Usage

```
update_state(obj, value)
```

Arguments

obj	Drifter object
value	a value that represents a processed batch

Value

updated Drifter object

Examples

```
# See ?hcd_ddm for an example of DDM drift detector
```
