

# Package: metapower (via r-universe)

October 13, 2024

**Type** Package

**Title** Power Analysis for Meta-Analysis

**Version** 0.2.2

**Description** A simple and effective tool for computing and visualizing statistical power for meta-analysis, including power analysis of main effects (Jackson & Turner, 2017)<[doi:10.1002/jrsm.1240](https://doi.org/10.1002/jrsm.1240)>, test of homogeneity (Pigott, 2012)<[doi:10.1007/978-1-4614-2278-5](https://doi.org/10.1007/978-1-4614-2278-5)>, subgroup analysis, and categorical moderator analysis (Hedges & Pigott, 2004)<[doi:10.1037/1082-989X.9.4.426](https://doi.org/10.1037/1082-989X.9.4.426)>.

**Depends** R (>= 3.6)

**License** GPL-2

**Encoding** UTF-8

**LazyData** true

**Imports** cowplot (>= 1.0.0), dplyr (>= 0.8.5), ggplot2 (>= 3.3.0), knitr (>= 1.28), magrittr (>= 1.5), tidyr (>= 1.0.2), testthat (>= 2.3.2), rlang (>= 0.4.5)

**Suggests** rmarkdown (>= 2.1)

**VignetteBuilder** knitr

**RoxygenNote** 7.1.1

**NeedsCompilation** no

**Author** Jason Griffin [aut, cre]

**Maintainer** Jason Griffin <[jasongriffin138@gmail.com](mailto:jasongriffin138@gmail.com)>

**Repository** CRAN

**Date/Publication** 2021-02-08 13:20:02 UTC

homogen_power	<i>Compute Power for Test of Homogeneity in Meta-analysis</i>
---------------	---

---

### Description

Compute statistical power for the Test of Homogeneity for meta-analysis under both fixed- and random-effects models.

### Usage

```
homogen_power(
  effect_size,
  study_size,
  k,
  i2,
  es_type,
  p = 0.05,
  con_table = NULL
)
```

### Arguments

effect_size	Numerical value of effect size.
study_size	Numerical value for number number of participants (per study).
k	Numerical value for total number of studies.
i2	Numerical value for Heterogeneity estimate ( $i^2$ ).
es_type	'Character reflecting effect size metric: 'r', 'd', or 'or'.
p	Numerical value for significance level (Type I error probability).
con_table	(Optional) Numerical values for 2x2 contingency table as a vector in the following format: c(a,b,c,d).

2x2 Table	Group 1	Group 2
Present	a	b
Not Present	c	d

**Value**

Estimated Power to detect differences in homogeneity of effect sizes for fixed- and random-effects models

**References**

**See Also**

[https://jason-griffin.shinyapps.io/shiny\\_metapower/](https://jason-griffin.shinyapps.io/shiny_metapower/)

**Examples**

```
homogen_power(effect_size = .5, study_size = 10, k = 10, i2 = .50, es_type = "d")
```

---

mod\_power

*Compute Power for Categorical Moderator Analysis in Meta-analysis*

---

**Description**

Computes statistical power for categorical moderator analysis under fixed and random effects models.

**Usage**

```
mod_power(  
  n_groups,  
  effect_sizes,  
  study_size,  
  k,  
  i2,  
  es_type,  
  p = 0.05,  
  con_table = NULL  
)
```

**Arguments**

n_groups	Numerical value for the levels of a categorical variable.
effect_sizes	Numerical values for effect sizes of for each group.
study_size	Numerical value for number of participants (per study).
k	Numerical value for total number of studies.
i2	Numerical value for Heterogeneity estimate ( $i^2$ ).
es_type	Character reflecting effect size metric: 'r', 'd', or 'or'.
p	Numerical value for significance level (Type I error probability).
con_table	(Optional) List of numerical values for 2x2 contingency tables as a vector in the following format: c(a,b,c,d). These should be specified for each group(i.e., n_groups).

2x2 Table	Group 1	Group 2
Present	a	b
Not Present	c	d

**Value**

Estimated Power estimates for moderator analysis under fixed- and random-effects models

**See Also**

[https://jason-griffin.shinyapps.io/shiny\\_metapower/](https://jason-griffin.shinyapps.io/shiny_metapower/)

**Examples**

```
mod_power(n_groups = 2,
          effect_sizes = c(.1,.5),
          study_size = 20,
          k = 10,
          i2 = .50,
          es_type = "d")
mod_power(n_groups = 2,
          con_table = list(g1 = c(6,5,4,5), g2 = c(8,5,2,5)),
          study_size = 40,
          k = 20,
          i2 = .50,
          es_type = "or")
```

---

 mpower

---

*Compute Power for Meta-analysis*

---

## Description

Computes statistical power for summary effect sizes in meta-analysis.

## Usage

```
mpower(
  effect_size,
  study_size,
  k,
  i2,
  es_type,
  test_type = "two-tailed",
  p = 0.05,
  con_table = NULL
)
```

## Arguments

effect_size	Numerical value of effect size.
study_size	Numerical value for number number of participants (per study).
k	Numerical value for total number of studies.
i2	Numerical value for Heterogeneity estimate ( $i^2$ ).
es_type	Character reflecting effect size metric: 'r', 'd', or 'or'.
test_type	Character value reflecting test type: ("two-tailed" or "one-tailed").
p	Numerical value for significance level (Type I error probability).
con_table	(Optional) Numerical values for 2x2 contingency table as a vector in the following format: c(a,b,c,d).

2x2 Table	Group 1	Group 2
Present	a	b
Not Present	c	d

## Value

Estimated Power

## Examples

```
mpower(effect_size = .2, study_size = 10, k = 10, i2 = .5, es_type = "d")
```

---

plot\_homogen\_power      *Plot Power Curve for Test of Homogeneity*

---

## Description

Plots power curves for the test of homogeneity for different levels of within-study variation for fixed effects models. For random-effects models, power curves are plotted for various levels of heterogeneity.

## Usage

```
plot_homogen_power(obj)
```

## Arguments

obj                      should be an "homogen\_power" object

## Value

Power curve plot for the user specified input parameters

---

`plot_mod_power`                      *Plot Power Curve for Categorical Moderators*

---

**Description**

Plots power curves for categorical moderator in meta-analysis

**Usage**

`plot_mod_power(obj)`

**Arguments**

`obj`                      This should be an 'mod\_power' object

**Value**

Power curves for moderator analysis under fixed and random effects models

---

`plot_mpower`                      *Plot Power Curve for Meta-analysis*

---

**Description**

Plots power curves for fixed effects models with various effect size magnitudes. Also plots power curves for various levels of heterogeneity (e.g.,  $i^2 = 75$ )

**Usage**

`plot_mpower(obj)`

**Arguments**

`obj`                      This should be an "mpower" object

**Value**

Power curve plot for the user specified input parameters

---

plot\_subgroup\_power      *Plot Power Curve for Subgroup analysis*

---

**Description**

Plots power curves to detect subgroup differences in meta-analysis.

**Usage**

```
plot_subgroup_power(obj)
```

**Arguments**

obj                      This should be an 'subgroup\_power' object

**Value**

Power curves to detect subgroup differences for fixed and random effects models

---

subgroup\_power              *Compute Power for Subgroup Analysis in Meta-analysis*

---

**Description**

Computes statistical power for different subgroups under fixed and random effects models.

**Usage**

```
subgroup_power(  
  n_groups,  
  effect_sizes,  
  study_size,  
  k,  
  i2 = 0.5,  
  es_type,  
  p = 0.05,  
  con_table = NULL  
)
```

**Arguments**

n_groups	Numerical value for the number of subgroups.
effect_sizes	Numerical values for effect sizes of for each group.
study_size	Numerical value for number of participants (per study).
k	Numerical value for total number of studies.
i2	Numerical value for Heterogeneity estimate ( $i^2$ ).
es_type	Character reflecting effect size metric: 'r', 'd', or 'or'.
p	Numerical value for significance level (Type I error probability).
con_table	(Optional) List of numerical values for 2x2 contingency tables as a vector in the following format: c(a,b,c,d). These should be specified for each subgroup (i.e., n_groups).

2x2 Table	Group 1	Group 2
Present	a	b
Not Present	c	d

**Value**

Estimated Power estimates for subgroup differences under fixed- and random-effects models

**See Also**

[https://jason-griffin.shinyapps.io/shiny\\_metapower/](https://jason-griffin.shinyapps.io/shiny_metapower/)

**Examples**

```
subgroup_power(n_groups = 2,
  effect_sizes = c(.1,.5),
  study_size = 20,
  k = 10,
  i2 = .5,
  es_type = "d")
subgroup_power(n_groups = 2,
  con_table = list(g1 = c(6,5,4,5), g2 = c(8,5,2,5)),
  study_size = 40,
  k = 20,
  i2 = .5,
  es_type = "or")
```
