

# Package: mimdo (via r-universe)

August 21, 2024

**Type** Package

**Title** Multivariate Imputation by Mahalanobis Distance Optimization

**Version** 0.1.0

**Author** Geovert John Labita [aut, cre]

**Maintainer** Geovert John Labita <geovertjohn.labita@ustp.edu.ph>

**Description** Imputes missing values of an incomplete data matrix by minimizing the Mahalanobis distance of each sample from the overall mean [Labita, G.J.D. and Tubo, B.F. (2024) <doi:10.24412/1932-2321-2024-278-115-123>].

**License** GPL-3

**Encoding** UTF-8

**RoxygenNote** 7.3.1

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2024-07-21 09:20:02 UTC

## Description

Imputes missing values of an incomplete data matrix by minimizing the Mahalanobis distance of each sample from the overall mean. By utilizing Mahalanobis distance, this imputation method is preferable to be used on datasets with highly correlated variables.

**Usage**

```
mimdo(incomplete_data, inverse, iterations = 30)
```

**Arguments**

<code>incomplete_data</code>	A data frame with missing values.
<code>inverse</code>	If TRUE, the inverse covariance matrix will be used for distance calculation. If the covariance matrix is non-invertible, use <code>inverse = FALSE</code> .
<code>iterations</code>	Number of iterations. It can be adjusted to avoid long running time.

**Value**

The output returns a data frame of the complete imputed data. This means that the missing values of the original incomplete dataset have been imputed. If the function does not return a value, this means that the covariance matrix is not invertible and is exactly singular.

**Author(s)**

Geovert John D. Labita

**Examples**

```
incomplete_data<-as.data.frame(matrix(c(5.1,NA,4.7,NA,3.0,3.2,1.4,1.4,NA,0.2,0.2,NA),nrow=3))
mimdo(incomplete_data, inverse=FALSE)
```
