

# Package: mixor (via r-universe)

July 3, 2026

**Type** Package

**Title** Mixed-Effects Ordinal Regression Analysis

**Version** 1.0.7

**Date** 2026-07-02

**Maintainer** Kellie J. Archer <archer.43@osu.edu>

**Description** Provides the function 'mixor' for fitting a mixed-effects ordinal and binary response models and associated methods for printing, summarizing, extracting estimated coefficients and variance-covariance matrix, and estimating contrasts for the fitted models.

**License** GPL (>= 2)

**Depends** R (>= 4.6.0), survival

**BuildResaveData** best

**Biarch** yes

**NeedsCompilation** yes

**SystemRequirements** GNU make

**LazyLoad** true

---

AIC.mixor

*Return AIC for a Fitted Mixor Model*

---

## Description

Returns the AIC of a fitted mixor model.

## Usage

```
## S3 method for class 'mixor'
AIC(object, ...)
```

## Arguments

object            a mixor object.  
 ...              other arguments.

**Value**

AIC of the fitted mixor model.

**Author(s)**

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

**See Also**

See Also as [mixor](#), [summary.mixor](#)

**Examples**

```
library("mixor")
data("schizophrenia")
### Random intercept
SCHIZ01.fit<-mixor(imp79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
  id=id, link="probit")
summary(SCHIZ01.fit)
AIC(SCHIZ01.fit)
```

---

BIC.mixor

*Return BIC for a Fitted Mixor Model*

---

**Description**

Returns the BIC of a fitted mixor model.

**Usage**

```
## S3 method for class 'mixor'
BIC(object, ...)
```

**Arguments**

object            a mixor object.  
...                other arguments.

**Value**

BIC of the fitted mixor model.

**Author(s)**

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

**See Also**

See Also as [mixor](#), [summary.mixor](#)

**Examples**

```
library("mixor")
data("schizophrenia")
### Random intercept
SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
  id=id, link="probit")
summary(SCHIZ01.fit)
BIC(SCHIZ01.fit)
```

coef.mixed

*Extract Model Coefficients***Description**

coef.mixed is a generic function which extracts the model coefficients from a fitted model object fit using mixor

**Usage**

```
## S3 method for class 'mixor'
coef(object, ...)
```

**Arguments**

```
object      a mixor object.
...         other arguments.
```

**Value**

Coefficients extracted from the model object.

**Author(s)**

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

**See Also**

See Also as [mixor](#), [summary.mixed](#)

**Examples**

```
library("mixor")
data("schizophrenia")
### Random intercept model
SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
  id=id, link="probit")
coef(SCHIZ01.fit)
```

---

 concen

*Twins Trouble Concentrating Data*

---

## Description

Monozygotic and dizygotic twins trouble concentrating data

## Usage

```
data(concen)
```

## Format

A data frame with 16 observations on the following 6 variables.

ID a numeric vector indicating the unique twin pair ID

TConcen an indicator variable representing trouble concentrating (0 = absent, 1 = present)

int a numeric vector of ones; used in the stand-alone MIXOR program to represent the intercept

Mz an indicator variable representing MZ twins (1 = MZ, 0 = DZ)

Dz an indicator variable representing DZ twins (1 = DZ, 0 = MZ)

freq a numeric vector representing the frequency of the pattern

## References

Ramakrishnan V. et al (1992) Elementary methods for the analysis of dichotomous outcomes in unselected samples of twins *Genetic Epidemiology* 9, 273-287.

## Examples

```
library("mixor")
data("concen")
# sort the data by twin pair ID
concen<-concen[order(concen$ID),]
# common ICC probit model
Common.ICC<-mixor(TConcen~Mz, data=concen, id=ID, weights=freq,
  link="probit", nAGQ=10, random.effect.mean=FALSE)
summary(Common.ICC)
# Varying ICC probit model
Varying.ICC<-mixor(TConcen~Mz+Dz, data=concen, id=ID, weights=freq,
  which.random.slope=1:2, exclude.fixed.effect=2, link="probit",
  nAGQ=20, random.effect.mean=FALSE, UNID=1)
summary(Varying.ICC)
```

---

 Contrasts

*Estimate Contrasts for Mixor Object*

---

**Description**

This function is used to specify and estimate contrasts of interest for a mixor object.

**Usage**

```
Contrasts(fit, contrast.matrix, digits=max(3, getOption("digits") - 2),
          signif.stars=TRUE, dig.tst = max(1, min(5, digits - 1)))
```

**Arguments**

<code>fit</code>	A mixor object.
<code>contrast.matrix</code>	A matrix of contrasts of interest. Each column in the contrast matrix should be of the same length as the coef vector of the fitted mixor object.
<code>digits</code>	minimum number of significant digits to be used for most numbers.
<code>signif.stars</code>	logical; if TRUE, P-values are additionally encoded visually as "significance stars" in order to help scanning of long coefficient tables.
<code>dig.tst</code>	minimum number of significant digits for the test statistics.

**Value**

A list containing the following components:

<code>contrast.matrix</code>	a matrix specifying the contrasts of interest.
<code>Contrasts</code>	a matrix containing the estimates, SEs, Z-values, and p-values for the contrasts of interest.

**Author(s)**

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

**See Also**

See Also as [mixor](#), [coef.mixor](#), [vcov.mixor](#)

**Examples**

```

library("mixor")
data("SmokingPrevention")
# data frame must be sorted by id variable
SmokingPrevention<-SmokingPrevention[order(SmokingPrevention$class),]
Fitted.students<-mixor(thksord~thkspre+cc+tv+cctv, data=SmokingPrevention,
  id=class, link="logit")
summary(Fitted.students)
coef(Fitted.students)
vcov(Fitted.students)
cm<-matrix(c(-1,-1,-1,0,0,0,0,0,
            0, 0, 0,0,0,0,0,0,
            0, 0, 0,1,0,0,0,1),ncol=3,byrow=TRUE)
Contrasts(Fitted.students, contrast.matrix=cm)

```

---

deviance.mixor	<i>Return the deviance for a Fitted Mixor Model</i>
----------------	---

---

**Description**

Returns the deviance of a fitted mixor model.

**Usage**

```

## S3 method for class 'mixor'
deviance(object, ...)

```

**Arguments**

object	a mixor object.
...	other arguments.

**Value**

Deviance of the fitted mixor model.

**Author(s)**

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

**See Also**

See Also as [mixor](#), [summary.mixor](#), [logLik.mixor](#)

**Examples**

```

library("mixor")
data("schizophrenia")
### Random intercept
SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
  id=id, link="probit")
summary(SCHIZ01.fit)
deviance(SCHIZ01.fit)

```

---

 irt.data

---

*Armed Services Vocational Aptitude Battery*

---

**Description**

Arithmetic reasoning items from the Armed Services Vocational Aptitude Battery

**Usage**

```
data(irt.data)
```

**Format**

A data frame with 128 observations on the following 13 variables.

ID a numeric vector indicating unique pattern identifier

Resp item response (0 = incorrect; 1 = correct)

int a numeric vector of ones; used in MIXOR stand-alone program to represent the intercept

Item1 Arithmetic reasoning item 1 (0 = no; 1 = yes)

Item2 Arithmetic reasoning item 2 (0 = no; 1 = yes)

Item3 Arithmetic reasoning item 3 (0 = no; 1 = yes)

Item4 Arithmetic reasoning item 4 (0 = no; 1 = yes)

SexF an indicator variable representing gender (0 = female; 1 = male)

SexItem1 Gender by Item1 interaction

SexItem2 Gender by Item2 interaction

SexItem3 Gender by Item3 interaction

SexItem4 Gender by Item4 interaction

freq frequency weight of pattern

## Examples

```
library("mixor")
data("irt.data")
## Sort data by ID
irt.data<-irt.data[order(irt.data$ID),]
# 2 parameter logistic IRT model
Fitted.irt<-mixor(Resp~Item1+Item2+Item3+Item4-1, data=irt.data, id=ID,
  weights=freq, which.random.slope=1:4, link="logit", nAGQ=10,
  random.effect.mean=FALSE, UNID=1, vcov=FALSE)
summary(Fitted.irt)
# 2 parameter logistic IRT model with Sex interactions on item parameters
Fitted.irt2<-mixor(Resp~Item1+Item2+Item3+Item4+SexItem1+SexItem2+SexItem3+SexItem4-1,
  data=irt.data, id=ID, weights=freq, which.random.slope=1:8, link="logit",
  nAGQ=10, random.effect.mean=FALSE, UNID=1, vcov=FALSE)
summary(Fitted.irt2)
```

---

logLik.mixor	<i>Return the log-likelihood for a Fitted Mixor Model</i>
--------------	---

---

## Description

Returns the log-likelihood of a fitted mixor model.

## Usage

```
## S3 method for class 'mixor'
logLik(object, ...)
```

## Arguments

object	a mixor object.
...	other arguments.

## Value

Log-likelihood of the fitted mixor model.

## Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

## See Also

See Also as [mixor](#), [summary.mixor](#), [deviance.mixor](#)

## Examples

```
library("mixor")
data("schizophrenia")

SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
  id=id, link="probit")
summary(SCHIZ01.fit)
logLik(SCHIZ01.fit)
```

---

 mixor

*Mixed-Effects Ordinal Regression Analysis*

---

## Description

This function fits mixed-effects ordinal and binary response models. Various link functions are supported including probit, logistic, and complementary log-log. For longitudinal data, the `mixor` function allows for individual varying intercepts and slopes across times.

## Usage

```
mixor(formula, data, id, which.random.slope = NA, subset, weights,
  exclude.fixed.effect = NA, CONV = 1e-04, empirical.prior = FALSE,
  quadrature.dist = "Normal", nAGQ = 11, adaptive.quadrature = TRUE,
  link = "probit", KG = 0, KS = 0, IADD = -1, indep.re = FALSE,
  random.effect.mean = TRUE, UNID = 0, vcov = TRUE)
```

## Arguments

<code>formula</code>	an object of class " <code>formula</code> " (or one that can be coerced to that class): a symbolic description of the model to be fitted.
<code>data</code>	an optional <code>data.frame</code> containing the variables in the model. Note the <code>data.frame</code> must be sorted by <code>id</code> prior to invoking the <code>mixor</code> function.
<code>id</code>	name of clustering variable in the <code>data.frame</code>
<code>which.random.slope</code>	<code>which.random.slope=NA</code> means no random slope, only a random intercept is fit. To specify a random slope, <code>which.random.slope</code> is the number of the predictor variable on the RHS of the model formula. More than one variable can have a random slope.
<code>subset</code>	an optional vector specifying a subset of observations to be used in the fitting process.
<code>weights</code>	when supplied, indicates differential weights are used; otherwise each <code>id</code> is weighted equally. <code>weights</code> are the frequency weights to be assigned to each <code>id</code> .

<code>exclude.fixed.effect</code>	the RHS of the model includes both fixed and random effects. Variables are identified as random effects using <code>which.random.slope</code> . If it is desired that a variable be included in the model without a fixed effect (random only), the number of that variable(s) in the RHS formula should be passed to <code>exclude.fixed.effects</code> .
<code>CONV</code>	convergence criteria, default is 0.0001.
<code>empirical.prior</code>	logical. If TRUE, uses empirical prior for random effects.
<code>quadrature.dist</code>	distribution for random effects. Either "Normal" (default) or "Uniform".
<code>nAGQ</code>	number of quadrature nodes per dimension. For one random effect, <code>nAGQ=20</code> is reasonable but should be reduced to 5-10 for multiple random effects.
<code>adaptive.quadrature</code>	logical indicating whether adaptive quadrature (default) or non-adaptive quadrature is performed.
<code>link</code>	Link function, either "probit", "logit", or "cloglog"
<code>KG</code>	an optional integer reflecting the number of covariates to interact with threshold parameters (the first KG variables on the RHS of the model formula, so the order of the variables on the RHS of the model formula is important when using KG). Note that if KG is non-zero, KS must be zero.
<code>KS</code>	an optional integer reflecting the number of covariates used in scaling (the first KS variables on the RHS of the model formula, so the order of the variables on the RHS of the model formula is important when using KS). Note that if KS is non-zero, KG must be zero.
<code>IADD</code>	indicates how XB part of model is included; -1 subtract covariates and mean of random effects from thresholds; 1 add covariates and mean of random effects to thresholds. Default is -1 (subtract XB).
<code>indep.re</code>	logical. If TRUE, independent random effects. Default is FALSE which assumes correlated random effects.
<code>random.effect.mean</code>	logical. If TRUE, estimate the mean of the random effects.
<code>UNID</code>	indicator variable where 0 = random effects are multi-dimensional; 1 = random effects are variables related to a uni-dimensional random effect (e.g., item indicators of a latent variable).
<code>vcov</code>	logical. Default is <code>vcov=TRUE</code> which returns estimates of the the random-effect variance-covariance matrix. When <code>vcov=FALSE</code> , then estimates of the Cholesky (matrix square-root) of the random-effect variance-covariance matrix are returned.

## Details

A typical model has the form `response ~ terms` where `response` is the (numeric) response vector and `terms` is a series of terms which specifies a linear predictor for response. The response can also be a censored survival response, of the form `Surv(time,censorvariable)`

**Value**

A list with components:

call	Model call formula
Deviance	Model deviance
Quadrature.points	number of quadrature nodes per dimension used in fit
Model	a matrix summarizing the model fit including columns Estimate, SE, Z, and P-value
varcov	The variance-covariance matrix
EBmean	empirical Bayes estimates of the means of the posterior distribution for each id
EBvar	empirical Bayes estimates of posterior variance/covariance for each id)
RIDGEMAX	Ridge
RLOGL	Log-likelihood
SE	a matrix corresponding the standard errors of the parameters estimates in coef
AIC	AIC
SBC	Schwarz criterion
AICD	Akaike information criterion
SBCD	deviance information criterion
MU	mean of random effects
ALPHA	fixed effects estimates
SIGMA	random effects variance-covariance matrix
GAM	thresholds
TAU	scaling parameter estimates when proportional odds are not assumed. Returns when KG is non-zero.
IADD	indicates how the XB part of model was included; -1 subtract covariates and mean of random effects from thresholds; 1 add covariates and mean of random effects to thresholds.
Y	the response from the fitted model.
X	the random effects terms from the fitted model.
W	the fixed effects terms from the fitted model.
MAXJ	the number of ordinal levels.
random.effect.mean	If TRUE, the mean of the random effects was estimated.
KS	integer reflecting the number of covariates that were specified to use in scaling (the first KS variables on the RHS of the model formula).
KG	integer reflecting the number of covariates that were specified to interact with the threshold parameters (the first KG variables on the RHS of the model formula).
id	name of clustering variable in the data.frame

which.random.slope	the number of the predictor variable on the RHS of the model formula having a random slope. When which.random.slope=NA, only a random intercept model was fit.
ICEN	if 1 indicates right-censoring was considered in the model fit.
link	Link function, either "probit", "logit", or "cloglog"
terms	terms from the fitted model.

### Note

This function is essentially a wrapper for the MIXOR stand-alone program by Hedeker and Gibbons with added generic methods in R to enhance functionality. Note that the Fortran wrapper requires missing values to be denoted by -9 rather than NA.

---

mixord      *Old Function Name Replaced with mixor*

---

### Description

The `mixord` function has been deprecated. Please use the `mixor` function for fitting longitudinal/clustered ordinal response models

### Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

### See Also

See Also as [mixor](#), [summary.mixor](#)

**Description**

Each subject provided ordinal responses on three items concerning their opinion on early teens (age 14-16) having sex before marriage (Item1), a man and a woman having sex before marriage (Item2), and a married person having sex with someone other than their spouse (Item3). Data are provided as frequencies by response pattern.

**Usage**

```
data(norcag)
```

**Format**

A data frame with 105 observations on the following 6 variables.

ID a numeric vector indicating unique patient identifier

SexItems ordinal item response coded as 1 = always wrong; 2 = almost always wrong; 3 = wrong only sometimes; 4 = not wrong

int a numeric vector of ones; used in the stand-alone MIXOR program to indicate the intercept

Item2vs1 attitude towards premarital vs teenage sex

Item3vs1 attitude towards extramarital vs teenage sex

freq frequency weight of the pattern

summary(Fitted.norcag.scale)
```

---

plot.mixor	<i>Plot empirical Bayes estimates of random effects for a Mixor Model Object</i>
------------	--

---

### Description

Plot of empirical Bayes estimates of random effects from a fitted mixor model object.

### Usage

```
## S3 method for class 'mixor'
plot(x, ...)
```

### Arguments

x	a mixor object.
...	other arguments.

### Value

For each random effect, a histogram and normal quantile-quantile plot of empirical Bayes estimates.

### Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

  id=id, link="probit")
plot(SCHIZ01.fit)
```

---

predict.mixed	<i>Predict Outcome From Mixed Fitted Model</i>
---------------	--

---

### Description

predict method for class mixed.

### Usage

```
## S3 method for class 'mixed'  
predict(object, newdata = NULL, na.action = na.fail, ...)
```

### Arguments

object	an object of class mixed.
newdata	an optional data frame to be used for obtaining predictions when the random effects are zero. When newdata is not supplied, the random effects estimates are used in obtaining model predictions. All variables used in the mixed model, the fixed and the random effects models, as well as the grouping factors, must be present in the data frame.
na.action	a function that indicates what should happen when newdata contains NAs. The default action (na.fail) causes the function to print an error message and terminate if there are any incomplete observations.
...	other arguments.

### Details

This function returns fitted probabilities and the predicted class from a fitted mixed object. When the newdata parameter is specified, the random effects are taken to be zero and predictions are returned. Otherwise conditional predictions, which includes both fixed and random effects terms, for the observed data are returned.

### Value

predicted	class specific probabilities from the fitted model.
class	predicted class, that having the largest fitted probability, from the fitted model.

### Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

### See Also

See Also [mixed](#), [print.mixed](#)

## Examples

```
library("mixor")
data("schizophrenia")
### Random intercept
SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
  id=id, link="probit")
pihat<-predict(SCHIZ01.fit)
table(pihat$class, schizophrenia$imps79o)
head(pihat$predicted)
```

---

print.mixor

*Printing Mixor Model Fits*

---

## Description

print method for class mixor.

## Usage

```
## S3 method for class 'mixor'
print(x, digits = max(3L, getOption("digits") - 3L), ...)
```

## Arguments

x                    an object of class mixor.  
digits                the number of significant digits to use when printing.  
...                   further arguments passed to or from other methods.

## Value

The function `print.mixor` prints the model call and coefficients from the `mixor` object.

## Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

schizophrenia

*National Institute of Mental Health Schizophrenia Collaborative Study*

---

**Description**

In the NIMH Schizophrenia Collaborative Study, patients were randomized to receive one of four medications, either placebo or one of three different anti-psychotic drugs. The protocol indicated subjects were to then be evaluated at weeks 0, 1, 3, 6 to assess severity of illness; additionally some measurements were made at weeks 2, 4, and 5.

**Usage**

```
data(schizophrenia)
```

**Format**

A data frame with 1603 observations on the following 9 variables.

`id` a numeric vector indicating the unique patient identifier

`imps79` a numeric vector from item 79 on the Inpatient Multidimensional Psychiatric Scale indicating severity of illness. The scores were applied to be interpreted as follows: 1 = normal, not ill at all; 2 = borderline mentally ill; 3 = mildly ill; 4 = moderately ill; 5 = markedly ill; 6 = severely ill; 7 = among the most extremely ill

`imps79b` a binary version of `imps79`

`imps79o` an ordinally scaled version of `imps79`

`int` a numeric vector of ones; used in stand-alone package to indicate intercept

`TxDrug` a numeric vector indicating treatment with drug (1) or placebo (0)

`Week` a numeric vector indicating time, in weeks

`SqrtWeek` the square root of the `Week` variable

`TxSWeek` a variable representing the `TxDrug` x `Week` interaction

SmokeOnset

*Smoking Onset Data*

---

## Description

From the Television School and Family Smoking Prevention and Cessation Project, a study designed to increase knowledge of the effects of tobacco use in school-age children.

## Usage

```
data(SmokeOnset)
```

## Format

A data frame with 1556 observations on the following 10 variables.

`school` a numeric vector identifying the unique school in the Los Angeles area

`class` a numeric vector identifying classroom

`student` a numeric vector identifying student

`smkonset` a numeric vector indicating time to smoking or right-censoring (post-intervention=1, 1 year follow-up=2, and 2 year follow-up=3). For these data right-censoring means that the observation was observed at the indicated timepoint (and had not smoked at that timepoint or at earlier timepoints), but was not observed at subsequent timepoints or thereafter.

`event` a numeric vector indicating whether the student smoked (1) or did not (0)

`int` a numeric vector of ones; used in stand-alone MIXOR program to represent the intercept

SexMale a numeric vector indicating gender of the student (0=Female, 1=Male)

cc a numeric vector indicating whether the school was randomized to a social-resistance classroom curriculum (1=Yes, 0=No)

tv a numeric vector indicating whether the school was randomized to a media (television) intervention (1=Yes, 0=No)

cctv a numeric vector indicating whether the school was randomized to CC combined with TV

SmokingPrevention	<i>Television School and Family Smoking Prevention and Cessation Project Data</i>
-------------------	---

---

## Description

From the Television School and Family Smoking Prevention and Cessation Project, a study designed to increase knowledge of the effects of tobacco use in school-age children.

**Usage**

```
data(SmokingPrevention)
```

**Format**

A data frame with 1600 observations on the following 9 variables.

`school` a numeric vector identifying the Los Angeles school

`class` a numeric vector identifying classroom

`thksord` a numeric vector reflecting quartiles of the post-intervention tobacco and health knowledge scale score

`thksbin` a binary version of the post-intervention tobacco and health knowledge scale score

`int` a numeric vector of ones; used in the stand-alone MIXOR program to represent the intercept

`thkspre` the pre-intervention tobacco and health knowledge scale score

`cc` a numeric vector indicating whether the school was randomized to a social-resistance classroom curriculum (1=Yes, 0=No)

`tv` a numeric vector indicating whether the school was randomized to a media (television) intervention (1=Yes, 0=No)

`cctv` a numeric vector indicating whether the school was randomized to CC combined with TV

#Fitted.students<-mixor(thksord~thkspre+cc+tv+cctv, data=SmokingPrevention,
#  id=class, link="logit")
#summary(Fitted.students)
#vcov(Fitted.students)
```

---

summary.mixor	<i>Summarize Mixor Model Fit</i>
---------------	----------------------------------

---

## Description

summary method for class mixor.

## Usage

```
## S3 method for class 'mixor'
summary(object, digits=max(3, getOption("digits") - 2),
        signif.stars=TRUE, dig.tst = max(1, min(5, digits - 1)), ...)
```

## Arguments

object	an object of class mixor.
digits	minimum number of significant digits to be used for most numbers.
signif.stars	logical; if TRUE, P-values are additionally encoded visually as "significance stars" in order to help scanning of long coefficient tables.
dig.tst	minimum number of significant digits for the test statistics.
...	other arguments.

## Value

Prints the following items extracted from the fitted mixor object: the call to mixor (model formula), mode Deviance, Log-likelihood, RIDGEMAX, AIC, SBC, and model parameter estimates along with their SE, Z, and p-value.

## Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

summary(SCHIZ01.fit)
```

---

`vcov.mixed`*Return Variance-Covariance Matrix for a Mixed Model Object*

---

**Description**

Returns the variance-covariance matrix of a fitted `mixed` model object.

**Usage**

```
## S3 method for class 'mixed'  
vcov(object, ...)
```

**Arguments**

<code>object</code>	a <code>mixed</code> object.
<code>...</code>	other arguments.

**Value**

A matrix of the estimated covariances between the parameter estimates in the model.

**Author(s)**

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons
