Package: randompack (via r-universe)

May 22, 2026

Type Package

Title Fast Random Number Generation with Multiple Engines and Distributions

Version 0.1.3

Author Kristján Jónasson [aut, cre]

Maintainer Kristján Jónasson <jonasson@hi.is>

Description Random number generation library implemented in C with multiple engines and distribution functions, providing an R interface focused on correctness, speed, and reproducibility. Supports various PRNGs including xoshiro256++/**, PCG64, Philox, and ChaCha20, with methods for continuous, discrete, and multivariate distributions.

`randompack-package` *randompack: Fast Random Number Generation with Multiple Engines and Distributions*

Description

Random number generation library implemented in C with multiple engines and distribution functions, providing an R interface focused on correctness, speed, and reproducibility. Supports various PRNGs including xoshiro256++/**, PCG64, Philox, and ChaCha20, with methods for continuous, discrete, and multivariate distributions.

Quick Start

Create an RNG instance with `randompack_rng()` and use its methods to generate random variates:

```
rng <- randompack_rng()                # Default: x256++simd
rng <- randompack_rng("pcg64")         # Specify engine
x <- rng$normal(100, mu=1, sigma=2)    # Generate 100 N(1,2) variates
```

Available Engines

Among the supported underlying random number generators (engines) are xoshiro256++, xoshiro256**, PCG64 DXSM, sfc64, Philox-4x64, and ChaCha20. See `randompack_rng` for a complete list.

Author(s)

Maintainer: Kristján Jónasson <jonasson@hi.is>

randompack_engines *Available RNG Engines*

Description

Returns a data frame of supported random number generator engines with their descriptions.

Usage

```
randompack_engines()
```

Value

A data.frame with columns `engine` (short name) and `description` (full name and citation).

randompack_rng *Create and Use Random Number Generators*

Description

To create a random number generator (RNG) object use `randompack_rng()`, and to specify the underlying RNG engine use `randompack_rng(engine)` where `engine` is a character string naming the engine (see Available Engines below).

Usage

```
randompack_rng(engine = "x256++simd", bitexact = FALSE, full_mantissa = FALSE)
```

Arguments

`engine`	RNG engine
`bitexact`	Logical; set TRUE to make samples bit-identical across platforms
`full_mantissa`	Logical; set TRUE to use full mantissas for floating draws

Details

Once created, the RNG object provides methods for drawing samples from various distributions (e.g., `$normal()`, `$uniform()`, `$int()`). The object can be configured using configure methods (e.g., `$seed()`, `$randomize()`). Multiple independent RNG objects can be used for parallel random number generation across different processes or threads.

Value

An RNG object with methods for drawing random variates.

Available Engines

`x256++simd`	xorshift256++ with streams (default)
`sfc64simd`	sfc64 with streams
`x256++`	xoshiro256++ (Vigna and Blackman, 2018)
`x256**`	xoshiro256** (Vigna and Blackman, 2018)
`x128+`	xorshift128+ (Vigna, 2014)
`xoro++`	xoroshiro128++ (Vigna and Blackman, 2016)
`pcg64`	PCG64 DXSM (O'Neill, 2014)
`sfc64`	sfc64 (Chris Doty-Humphrey, 2013)
`squares`	squares64 (Widynski, 2021)
`philox`	Philox-4×64 (Salmon and Moraes, 2011)
`cwg128`	cwg128 (Działa, 2022)
`ranlux++`	ranlux++ (Sibidanov, 2017)
`chacha20`	ChaCha20 (Bernstein, 2008)

Continuous distributions

The RNG object provides methods for generating random variates from common continuous probability distributions. All methods return a numeric vector of length `len`.

`rng$unif(len)` Uniform variates on [0,1).

`rng$unif(len, a, b)` Uniform variates on [a,b) with `a < b`.

`rng$normal(len)` Standard normal variates (mean 0 and standard deviation 1).

`rng$normal(len, mu, sigma)` Normal variates with mean `mu` and standard deviation `sigma` (defaults 0 and 1).

`rng$skew_normal(len, mu, sigma, alpha)` Skew-normal variates with location `mu` and scale `sigma` (defaults 0 and 1), and shape `alpha` (required).

`rng$lognormal(len, mu, sigma)` Lognormal variates derived from an underlying normal distribution (defaults 0 and 1).

`rng$exp(len)` Standard exponential variates (scale 1).

`rng$exp(len, scale)` Exponential variates with scale `scale`.

`rng$gamma(len, shape, scale)` Gamma variates with given shape and scale (default 1).

`rng$chi2(len, nu)` Chi-square variates with `nu` degrees of freedom.

`rng$beta(len, a, b)` Beta variates with shape parameters `a` and `b`.

`rng$t(len, nu)` Student's t variates with `nu` degrees of freedom.

`rng$f(len, nu1, nu2)` F variates with `nu1` and `nu2` degrees of freedom.

`rng$gumbel(len, mu, beta)` Gumbel variates with location `mu` and scale `beta` (defaults 0 and 1).

`rng$pareto(len, xm, alpha)` Pareto variates with minimum value `xm` and shape `alpha`.

`rng$weibull(len, shape, scale)` Weibull variates with given shape and scale (default 1).

`rng$mvn(n, Sigma, mu = NULL)` Multivariate normal variates as an `n` by `d` matrix, where `d` is the dimension of `Sigma`.

Discrete distributions

The RNG object provides methods for generating random variates from common discrete distributions and combinatorial constructions.

`rng$int(len, min, max)` Uniform integers on `[min, max]`.

`rng$perm(n)` Random permutation of `1:n`.

`rng$sample(n, k)` Sample `k` elements without replacement from `1:n`.

`rng$raw(len)` Generate `len` random bytes as a raw vector.

Configuration and Copying

Methods for creating, configuring, and managing RNG state. All state-setting methods accept numeric vectors (double or integer) whose elements must be nonnegative whole numbers not exceeding $2^{32} - 1$. Where applicable, shorter vectors are padded with zeros.

`rng$seed(seed, spawn_key = integer(0))` Reinitialize the RNG deterministically from `seed` and an optional numeric vector `spawn_key`.

`rng$randomize()` Randomize the RNG state from system entropy.

`rng$jump(p)` Jump an xor-family or `ranlux++` engine ahead by 2^p steps. The `x128+` and `xoro128++` engines support `p = 32, 64, 96`, while `x256++`, `x256**`, `x256++simd`, and `ranlux++` also support `p = 128` and `p = 192`.

`rng$advance(delta)` Advance the `pcg64` engine by an arbitrary 128-bit delta. `delta` may be a scalar, interpreted as `[delta, 0]`, or have length up to 4; shorter vectors are zero-padded.

`rng$duplicate()` Duplicate the RNG, preserving its state.

`rng$serialize()` Serialize the current RNG state as a raw vector.

`rng$deserialize(raw_state)` Restore state from a raw vector created by `serialize()`.

`rng$set_state(state)` Set the engine state directly (advanced use).

`rng$pcg64_set_inc(inc)` Set the increment of the PCG64 engine. The increment may have length up to 4 and shorter vectors are zero-padded.

`rng$cwg128_set_weyl(weyl)` Set the Weyl increment of the cwg128 engine. `weyl` may have length up to 4 and shorter vectors are zero-padded.

`rng$sfc64_set_abc(abc)` Set the `a`, `b`, `c` state words of the sfc64 engine. `abc` may have length up to 6 and shorter vectors are zero-padded.

`rng$chacha_set_nonce(nonce)` Set the nonce of the ChaCha20 engine. The nonce may have length up to 3 and shorter vectors are zero-padded.

`rng$philox_set_key(key)` Set the key of the Philox engine. The key may have length up to 4 and shorter vectors are zero-padded.

`rng$squares_set_key(key)` Set the key of the Squares engine. The key may have length up to 2 and shorter vectors are zero-padded.

Examples

```
# Create an RNG
rng <- randompack_rng()                    # Default engine (xoshiro256++)
rng_pcg <- randompack_rng("pcg64")         # Specify engine
rng_chacha <- randompack_rng("chacha20")

# Continuous distributions
x <- rng$unif(5)
x <- rng$normal(100)                    # Standard normal
x <- rng$normal(100, 1, 2)              # N(1,2)
x <- rng$skew_normal(100, mu=0, sigma=1, alpha=2)
x <- rng$lognormal(5)
x <- rng$beta(5, a=2, b=3)
Sigma <- diag(2)
x <- rng$mvn(10, Sigma, mu=c(1,2))

# Discrete distributions
x <- rng$int(5, min=1, max=10)
x <- rng$perm(5)
x <- rng$sample(10, k=3)
x <- rng$raw(4)

# Configuration and copying
rng$seed(12345)                          # seed for reproducibility
rng$randomize()                          # randomize from system entropy
rngm <- randompack_rng(full_mantissa = TRUE)  # 53-bit mantissas for doubles
rng2 <- rng$duplicate()                  # duplicate with same state
identical(rng$unif(3), rng2$unif(3))     # TRUE
raw_state <- rng$serialize()             # save state
rng3 <- randompack_rng()                 # another default RNG
rng3$deserialize(raw_state)              # restore state
identical(rng$unif(3), rng3$unif(3))     # TRUE
rng_sq <- randompack_rng("squares")      # engine-specific state setting
rng_sq$set_state(c(2, 0, 0, 0))          # counter = (2,0)
rng_sq$squares_set_key(c(3,4))
```
