

# Package: sreg (via r-universe)

March 9, 2025

**Type** Package

**Title** Stratified Randomized Experiments

**Version** 1.0.1

**Description** Estimate average treatment effects (ATEs) in stratified randomized experiments. 'sreg' is designed to accommodate scenarios with multiple treatments and cluster-level treatment assignments, and accommodates optimal linear covariate adjustment based on baseline observable characteristics. 'sreg' computes estimators and standard errors based on Bugni, Canay, Shaikh (2018) <[doi:10.1080/01621459.2017.1375934](https://doi.org/10.1080/01621459.2017.1375934)>; Bugni, Canay, Shaikh, Tabord-Meehan (2024+) <[doi:10.48550/arXiv.2204.08356](https://doi.org/10.48550/arXiv.2204.08356)>; and Jiang, Linton, Tang, Zhang (2023+) <[doi:10.48550/arXiv.2201.13004](https://doi.org/10.48550/arXiv.2201.13004)>.

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.3.2

**Imports** dplyr, extraDistr, rlang, tidyr, cli

**Suggests** haven, knitr, rmarkdown, testthat

**Depends** R (>= 2.10)

**Config/testthat/edition** 3

**VignetteBuilder** knitr

**URL** <https://github.com/jutrifonov/sreg>

**BugReports** <https://github.com/jutrifonov/sreg/issues>

**NeedsCompilation** no

**Author** Juri Trifonov [aut, cre, cph], Yuehao Bai [aut], Azeem Shaikh [aut], Max Tabord-Meehan [aut]

**Maintainer** Juri Trifonov <[jutrifonov@uchicago.edu](mailto:jutrifonov@uchicago.edu)>

**Repository** CRAN

**Date/Publication** 2025-02-06 23:20:02 UTC

**Config/pak/sysreqs** libicu-dev

AEJapp	<i>Replication data for: Iron Deficiency and Schooling Attainment in Peru (Chong et al, 2016)</i>
--------	---

---

### Description

The data is taken from Chong et al. (2016), who study the effect of iron deficiency anemia (i.e., anemia caused by a lack of iron) on school-age children's educational attainment and cognitive ability in Peru.

### Usage

```
data("AEJapp")
```

### Format

A data frame with 215 observations on the 62 variables.

### Source

Chong, A., Cohen, I., Field, E., Nakasone, E., and Torero, M. (2016). Replication data for: Iron Deficiency and Schooling Attainment in Peru. Nashville, TN: American Economic Association [publisher], 2016. Ann Arbor, MI: Inter-university Consortium for Political and Social Research [distributor], 2019-10-12. [doi:10.3886/E113624V1](https://doi.org/10.3886/E113624V1).

### References

### Examples

```
data(AEJapp)
```

---

print.sreg	<i>Print sreg Objects</i>
------------	---------------------------

---

**Description**

Print the summary table of estimation results for sreg objects.

**Usage**

```
## S3 method for class 'sreg'
print(x, ...)
```

**Arguments**

x	An object of class sreg.
...	Additional arguments passed to other methods.

**Value**

No return value, called for side effects.

**Examples**

```
data <- sreg.rgen(n = 200, tau.vec = c(0.1), n.strata = 4, cluster = TRUE)
Y <- data$Y
S <- data$S
D <- data$D
X <- data.frame("x_1" = data$x_1, "x_2" = data$x_2)
result <- sreg(Y, S, D, G.id = NULL, Ng = NULL, X)
print(result)
```

---

sreg	<i>Estimate Average Treatment Effects (ATEs) and Corresponding Standard Errors</i>
------	--

---

**Description**

Estimate the ATE(s) and the corresponding standard error(s) for a (collection of) treatment(s) relative to a control.

**Usage**

```
sreg(Y, S = NULL, D, G.id = NULL, Ng = NULL, X = NULL, HC1 = TRUE)
```

**Arguments**

Y	a numeric $n \times 1$ vector/matrix/data.frame/tibble of the observed outcomes
S	a numeric $n \times 1$ vector/matrix/data.frame/tibble of strata indicators indexed by $\{1, 2, 3, \dots\}$ ; if NULL then the estimation is performed assuming no stratification
D	a numeric $n \times 1$ vector/matrix/data.frame/tibble of treatments indexed by $\{0, 1, 2, \dots\}$ , where $D = 0$ denotes the control
G.id	a numeric $n \times 1$ vector/matrix/data.frame/tibble of cluster indicators; if NULL then estimation is performed assuming treatment is assigned at the individual level
Ng	a numeric $n \times 1$ vector/matrix/data.frame/tibble of cluster sizes; if NULL then Ng is assumed to be equal to the number of available observations in every cluster
X	a matrix/data.frame/tibble with columns representing the covariate values for every observation; if NULL then the estimator without linear adjustments is applied. (Note: sreg cannot use individual-level covariates for covariate adjustment in cluster-randomized experiments. Any individual-level covariates will be aggregated to their cluster-level averages)
HC1	a TRUE/FALSE logical argument indicating whether the small sample correction should be applied to the variance estimator

**Value**

An object of class `sreg` that is a list containing the following elements:

- `tau.hat`: a  $1 \times |\mathcal{A}|$  vector of ATE estimates, where  $|\mathcal{A}|$  represents the number of treatments
- `se.rob`: a  $1 \times |\mathcal{A}|$  vector of standard errors estimates, where  $|\mathcal{A}|$  represents the number of treatments
- `t.stat`: a  $1 \times |\mathcal{A}|$  vector of  $t$ -statistics, where  $|\mathcal{A}|$  represents the number of treatments
- `p.value`: a  $1 \times |\mathcal{A}|$  vector of corresponding  $p$ -values, where  $|\mathcal{A}|$  represents the number of treatments
- `CI.left`: a  $1 \times |\mathcal{A}|$  vector of the left bounds of the 95% as. confidence interval
- `CI.right`: a  $1 \times |\mathcal{A}|$  vector of the right bounds of the 95% as. confidence interval
- `data`: an original data of the form `data.frame(Y, S, D, G.id, Ng, X)`
- `lin.adj`: a `data.frame` representing the covariates that were used in implementing linear adjustments

**Examples**

```
library("sreg")
library("dplyr")
library("haven")
### Example 1. Simulated Data.
data <- sreg.rgen(n = 1000, tau.vec = c(0), n.strata = 4, cluster = FALSE)
Y <- data$Y
S <- data$S
D <- data$D
X <- data.frame("x_1" = data$x_1, "x_2" = data$x_2)
result <- sreg(Y, S, D, G.id = NULL, Ng = NULL, X)
print(result)
### Example 2. Empirical Data.
?AEJapp
data("AEJapp")
data <- AEJapp
head(data)
Y <- data$gradesq34
D <- data$treatment
S <- data$class_level
data.clean <- data.frame(Y, D, S)
data.clean <- data.clean %>%
  mutate(D = ifelse(D == 3, 0, D))
Y <- data.clean$Y
D <- data.clean$D
S <- data.clean$S
table(D = data.clean$D, S = data.clean$S)
result <- sreg(Y, S, D)
print(result)
pills <- data$pills_taken
age <- data$age_months
data.clean <- data.frame(Y, D, S, pills, age)
data.clean <- data.clean %>%
```

```

mutate(D = ifelse(D == 3, 0, D))
Y <- data.clean$Y
D <- data.clean$D
S <- data.clean$S
X <- data.frame("pills" = data.clean$pills, "age" = data.clean$age)
result <- sreg(Y, S, D, G.id = NULL, X = X)
print(result)

```

---

sreg.rgen

---

*Generate a Pseudo-Random Sample under the Stratified Block Randomization Design*

---

### Description

The function generates the observed outcomes, treatment assignments, strata indicators, cluster indicators, cluster sizes, and covariates for estimating the treatment effect within the context of a stratified block randomization design under the covariate-adaptive randomization (CAR).

### Usage

```

sreg.rgen(
  n,
  Nmax = 50,
  n.strata,
  tau.vec = c(0),
  gamma.vec = c(0.4, 0.2, 1),
  cluster = TRUE,
  is.cov = TRUE
)

```

### Arguments

n	a total number of observations in a sample
Nmax	a maximum size of generated clusters (maximum number of observations in a cluster)
n.strata	an integer specifying the number of strata
tau.vec	a numeric $1 \times  \mathcal{A} $ vector of treatment effects, where $ \mathcal{A} $ represents the number of treatments
gamma.vec	a numeric $1 \times 3$ vector of parameters corresponding to covariates
cluster	a TRUE/FALSE argument indicating whether the <code>dgp</code> should use a cluster-level treatment assignment or individual-level
is.cov	a TRUE/FALSE argument indicating whether the <code>dgp</code> should include covariates or not

**Value**

An object that is a 'data.frame' with  $n$  observations containing the generated values of the following variables:

- $Y$ : a numeric  $n \times 1$  vector of observed outcomes
- $S$ : a numeric  $n \times 1$  vector of strata indicators
- $D$ : a numeric  $n \times 1$  vector of treatments indexed by  $\{0, 1, 2, \dots\}$ , where  $D = 0$  denotes the control
- $G.id$ : a numeric  $n \times 1$  vector of cluster indicators
- $X$ : a data.frame with columns representing the covariate values for every observation

**Examples**

```
data <- sreg.rgen(n = 1000, tau.vec = c(0), n.strata = 4, cluster = TRUE)
```
