DSClassifier\_MOA      *DSClassifier\_MOA – MOA-based Stream Classifiers*

---

## Description

Interface for MOA-based stream classification methods based on package **RMOA**.

## Usage

```
DSClassifier_MOA(formula, RMOA_classifier)

## S3 method for class 'DSClassifier_MOA'
update(object, dsd, n = 1, verbose = FALSE, block = 1000L, ...)

## S3 method for class 'DSClassifier_MOA'
predict(object, newdata, type = "response", ...)
```

## Arguments

|                 |   |
|-----------------|---|
| formula         | a formula for the classification problem.                             |
| RMOA_classifier | a RMOA_classifier object.   |
| object          | a DSC object.   |
| dsd             | a data stream object.   |
| n               | number of data points taken from the stream.                          |
| verbose         | logical; show progress?   |
| block           | process blocks of data to improve speed.                              |
| ...             | further arguments.  |
| newdata         | dataframe with the new data.  |
| type            | prediction type (see <code>RMOA::predict.MOA_trainedmodel()</code> ). |

## Details

DSClassifier\_MOA provides an interface to MOA-based stream classifiers using package **RMOA**. RMOA provides access to MOAs stream classifiers in the following groups:

- [RMOA::MOA\\_classification\\_trees](#)
- [RMOA::MOA\\_classification\\_bayes](#)
- [RMOA::MOA\\_classification\\_ensemblelearning](#)

Subsequent calls to `update()` update the current model.

## Value

An object of class `DSClassifier_MOA`

## Author(s)

Michael Hahsler

## References

## Examples

```
## Not run:
library(streamMOA)
library(RMOA)

# create a data stream for the iris dataset
data <- iris[sample(nrow(iris)), ]
stream <- DSD_Memory(data)
stream

# define the stream classifier. MOAmodelOptions can be passed on as a control parameter
# to the call RMOA::HoeffdingTree(). See ? RMOA::MOAoptions
cl <- DSClassifier_MOA(
  Species ~ Sepal.Length + Sepal.Width + Petal.Length,
  RMOA::HoeffdingTree()
)

cl

# update the classifier with 100 points from the stream
update(cl, stream, 100)

# look at the classifier RMOA object
cl$RMOAobj
```

```
# predict the class for the next 50 points
newdata <- get_points(stream, n = 50)
pr <- predict(cl, newdata)
pr

table(pr, newdata$Species)

## End(Not run)
```

---

DSC\_BICO\_MOA

*BICO - Fast computation of k-means coresets in a data stream*

---

### Description

This is an interface to the MOA implementation of BICO. The original BICO implementation by Fichtenberger et al is also available as [stream::DSC\\_BICO](#).

### Usage

```
DSC_BICO_MOA(
  Cluster = 5,
  Dimensions,
  MaxClusterFeatures = 1000,
  Projections = 10,
  k = NULL,
  space = NULL,
  p = NULL
)
```

### Arguments

|                           |   |
|---------------------------|---|
| Cluster, k                | Number of desired centers   |
| Dimensions                | The number of the dimensions of the input points (stream) need to be specified in advance |
| MaxClusterFeatures, space | Maximum size of the coreset   |
| Projections, p            | Number of random projections used for the nearest neighbor search                         |

### Details

BICO maintains a tree which is inspired by the clustering tree of BIRCH, a SIGMOD Test of Time award-winning clustering algorithm. Each node in the tree represents a subset of these points. Instead of storing all points as individual objects, only the number of points, the sum and the squared sum of the subset's points are stored as key features of each subset. Points are inserted into exactly one node.

**Examples**

```
# data with 3 clusters and 2 dimensions
set.seed(1000)
stream <- DSD_Gaussians(k = 3, d = 2, noise = 0.05)

# cluster with BICO
bico <- DSC_BICO_MOA(Cluster = 3, Dimensions = 2)
update(bico, stream, 100)
bico

# plot micro and macro-clusters
plot(bico, stream, type = "both")
```

---

DSC\_CluStream

*CluStream Data Stream Clusterer*

---

**Description**

Class implements the CluStream cluster algorithm for data streams (Aggarwal et al, 2003).

**Usage**

```
DSC_CluStream(m = 100, horizon = 1000, t = 2, k = 5)
```

**Arguments**

|         |  |
|---------|--|
| m       | Defines the maximum number of micro-clusters used in CluStream   |
| horizon | Defines the time window to be used in CluStream  |
| t       | Maximal boundary factor (i.e., the kernel radius factor). When deciding to add a new data point to a micro-cluster, the maximum boundary is defined as a factor of t of the RMS deviation of the data points in the micro-cluster from the centroid. |
| k       | Number of macro-clusters to produce using weighted k-means.  |

**Details**

This is an interface to the MOA implementation of CluStream.

If  $k$  is specified, then CluStream applies a weighted  $k$ -means algorithm for reclustering (see Examples section below).

**Value**

An object of class DSC\_CluStream (subclass of [stream::DSC\\_Micro](#), [DSC\\_MOA](#) and [stream::DSC](#)).

**Author(s)**

Michael Hahsler and John Forrest

Other DSC\_MOA: [DSC\\_BICO\\_MOA\(\)](#), [DSC\\_ClusTree\(\)](#), [DSC\\_DStream\\_MOA\(\)](#), [DSC\\_DenStream\(\)](#), [DSC\\_MCOD\(\)](#), [DSC\\_MOA\(\)](#), [DSC\\_StreamKM\(\)](#)

**Examples**

```
# data with 3 clusters and 5% noise
set.seed(1000)
stream <- DSD_Gaussians(k = 3, d = 2, noise = .05)

# cluster with CluStream
clustream <- DSC_CluStream(m = 50, horizon = 100, k = 3)
update(clustream, stream, 500)
clustream

plot(clustream, stream, type = "both")
```

---

DSC\_ClusTree

*ClusTree Data Stream Clusterer*

---

**Description**

Interface for the MOA implementation of the ClusTree data stream clustering algorithm (Kranen et al, 2009).

## Usage

```
DSC_ClusTree(horizon = 1000, maxHeight = 8, lambda = NULL, k = NULL)
```

## Arguments

|           |   |
|-----------|---|
| horizon   | Range of the (time) window.                                     |
| maxHeight | The maximum height of the tree.                                 |
| lambda    | number used to override computed lambda (decay).                |
| k         | If specified, k-means with k clusters is used for reclustering. |

## Details

ClusTree uses a compact and self-adaptive index structure for maintaining stream summaries. Kranen et al (2009) suggest EM or k-means for reclustering.

## Value

An object of class DSC\_ClusTree (subclass of `stream::DSC`, `DSC_MOA`, `stream::DSC_Micro`).

## Author(s)

Michael Hahsler and John Forrest

## Examples

```
# data with 3 clusters
set.seed(1000)
stream <- DSD_Gaussians(k = 3, d = 2, noise = 0.05)

clustree <- DSC_ClusTree(maxHeight = 3)
update(clustree, stream, 500)
clustree

plot(clustree, stream)
```

```
#' Use automatically the k-means reclusterer with k = 3 to create macro clusters
clustree <- DSC_ClusTree(maxHeight = 3, k = 3)
update(clustree, stream, 500)
clustree

plot(clustree, stream, type = "both")
```

---

DSC\_DenStream

*DenStream Data Stream Clusterer*

---

### Description

Interface for the DenStream cluster algorithm for data streams implemented in MOA.

### Usage

```
DSC_DenStream(
  epsilon,
  mu = 1,
  beta = 0.2,
  lambda = 0.001,
  initPoints = 100,
  offline = 2,
  processingSpeed = 1,
  recluster = TRUE,
  k = NULL
)
```

### Arguments

|                 |  |
|-----------------|--|
| epsilon         | defines the epsilon neighborhood which is the maximal radius of micro-clusters ( $r \leq \epsilon$ ). Range: 0 to 1.     |
| mu              | minpoints as the weight $w$ a core-micro-clusters needs to be created ( $w \geq \mu$ ). Range: 0 to $\max(\text{int})$ . |
| beta            | multiplier for mu to detect outlier micro-clusters given their weight $w$ ( $w < \beta \times \mu$ ). Range: 0 to 1      |
| lambda          | decay constant.  |
| initPoints      | number of points to use for initialization via DBSCAN.   |
| offline         | offline multiplier for epsilon. Range: between 2 and 20). Used for reachability reclustering                             |
| processingSpeed | Number of incoming points per time unit (important for decay). Range: between 1 and 1000.                                |
| recluster       | logical; should the offline DBSCAN-based (i.e., reachability at a distance of epsilon) be performed?                     |
| k               | integer; tries to automatically chooses offline to find k macro-clusters.  |

## Details

DenStream applies reachability (from DBSCAN) between micro-clusters for reclustering using  $\epsilon \times \text{offline}$  (defaults to 2) as the reachability threshold.

If  $k$  is specified it automatically chooses the reachability threshold to find  $k$  clusters. This is achieved using single-link hierarchical clustering.

## Value

An object of class `DSC_DenStream` (subclass of `stream::DSC`, `DSC_MOA`, `stream::DSC_Micro`) or, for `recluster = TRUE`, an object of class `stream::DSC_TwoStage`.

## Examples

```
# data with 3 clusters and 5% noise
set.seed(1000)
stream <- DSD_Gaussians(k = 3, d = 2, noise = 0.05)

# use Den-Stream with reachability reclustering
denstream <- DSC_DenStream(epsilon = .05)
update(denstream, stream, 500)
denstream

# plot macro-clusters
plot(denstream, stream, type = "both")

# plot micro-cluster
plot(denstream, stream, type = "micro")

# show micro and macro-clusters
plot(denstream, stream, type = "both")

# reclustering: Choose reclustering reachability threshold automatically to find 4 clusters
```

```
denstream2 <- DSC_DenStream(epsilon = .05, k = 4)
update(denstream2, stream, 500)
plot(denstream2, stream, type = "both")
```

---

DSC\_DStream\_MOA

*D-Stream Data Stream Clustering Algorithm*

---

## Description

This is an interface to the MOA implementation of D-Stream. A C++ implementation (including reclustering with attraction) is available as [stream::DSC\\_DStream](#).

## Usage

```
DSC_DStream_MOA(decayFactor = 0.998, Cm = 3, Cl = 0.8, Beta = 0.3)
```

## Arguments

|             |  |
|-------------|--|
| decayFactor | The decay factor   |
| Cm          | Controls the threshold for dense grids   |
| Cl          | Controls the threshold for sparse grids  |
| Beta        | Adjusts the window of protection for renaming previously deleted grids as sporadic |

## Details

D-Stream creates an equally spaced grid and estimates the density in each grid cell using the count of points falling in the cells. Grid cells are classified based on density into dense, transitional and sporadic cells. The density is faded after every new point by a decay factor.

### Notes:

- This implementation seems to use a 1 x 1 grid and therefore the range is increased in the example.
- The MOA implementation of D-Stream currently does not return micro clusters.

update(dstream, stream, 1000)
dstream

# plot macro-clusters
plot(dstream, stream, type= "macro")
```

DSC\_MCOD

*Micro-cluster Continuous Outlier Detector (MCOD)***Description**

Class interfaces the MOA implementation of the MCODE algorithm for distance-based data stream outlier detection.

**Usage**

```
DSC_MCOD(r = 0.1, t = 50, w = 1000, recheck_outliers = FALSE)
DSOutlier_MCOD(r = 0.1, t = 50, w = 1000, recheck_outliers = TRUE)
get_outlier_positions(x, ...)
recheck_outlier(x, outlier_correlated_id, ...)
clean_outliers(x, ...)
```

**Arguments**

|                       |   |
|-----------------------|---|
| r                     | Defines the micro-cluster radius.   |
| t                     | Defines the number of neighbors (k in the article).                       |
| w                     | Defines the window width in data points.                                  |
| recheck_outliers      | Defines that the MCODE algorithm allows re-checking of detected outliers. |
| x                     | a DSC_MCOD object.  |
| ...                   | further arguments are currently ignored.                                  |
| outlier_correlated_id | ids of outliers.  |

## Details

The algorithm detects density-based outliers. An object  $x$  is defined to be an outlier if there are less than  $t$  objects lying at distance at most  $r$  from  $x$ .

Outliers are stored and can be retrieved using `get_outlier_position()` and `recheck_outlier()`.

**Note:** The implementation updates the clustering when `predict()` is called.

## Value

An object of class DSC\_MCOD (subclass of `stream::DSC_Micro`, `DSC_MOA` and `stream::DSC`).

## Functions

- `get_outlier_positions()`: Returns spatial positions of all current outliers.
- `recheck_outlier()`: DSC\_MCOD Re-checks the outlier having `outlier_correlated_id`. If this object is still an outlier, the method returns TRUE.
- `clean_outliers()`: forget detected outliers from the outlier detector (currently not implemented).

  measure = c("crand", "noisePrecision", "outlierjaccard"))
```

---

DSC\_MOA

*DSC\_MOA Class*

---

## Description

An abstract class that inherits from the base class [stream::DSC](#) and provides the common functions needed to interface MOA clusterers.

## Usage

```
DSC_MOA(...)
```

## Arguments

```
... further arguments.
```

## Details

DSC\_MOA is a subclass of [stream::DSC](#) for MOA-based clusterers. DSC\_MOA classes operate in a different way in that the centers of the micro-clusters have to be extracted from the underlying Java object. This is done by using **rJava** to perform method calls directly in the JRI and converting the multi-dimensional Java array into a local R data type.

**Note:** The formula interface is currently not implemented for MOA-based clusterers. Use [stream::DSF](#) to select features instead.

---

|              |                   |
|--------------|-------------------|
| DSC_StreamKM | <i>streamKM++</i> |
|--------------|-------------------|

---

### Description

This is an interface to the MOA implementation of streamKM++.

### Usage

```
DSC_StreamKM(sizeCoreset = 10000, numClusters = 5, length = 100000L, ...)
```

### Arguments

|             |                               |
|-------------|-------------------------------|
| sizeCoreset | Size of the coreset           |
| numClusters | Number of clusters to compute |
| length      | Length of the data stream     |
| ...         | Further arguments ignored.    |

### Details

streamKM++ uses a tree-based sampling strategy to obtain a small weighted sample of the stream called coreset. The MOA implementation applies the k-means++ algorithm to find a given number of centers in the coreset.

#### Notes:

- The cluster can only cluster the number of points specified in length and then produces an `ArrayIndexOutOfBoundsException` error.
- The coreset (micro-clusters are not accessible), only the macro-clusters can be requested.

DSD\_MOA

*Base class for MOA-based Data Stream Generators*

---

**Description**

Abstract base class for MOA-based data stream generators directly inherits from [stream::DSD](#).

**Usage**

```
DSD_MOA(...)
```

**Arguments**

```
...          further arguments.
```

**Value**

The abstract class cannot be instantiated and produces an error.

**Author(s)**

Michael Hahsler

**References**

**Examples**

```
DSD()
```

---

DSD\_RandomRBFGeneratorEvents

*Random RBF Generator Events Data Stream Generator*

---

## Description

A class that generates random data based on RandomRBFGeneratorEvents implemented in MOA.

## Usage

```
DSD_RandomRBFGeneratorEvents(
    k = 3,
    d = 2,
    numClusterRange = 3L,
    kernelRadius = 0.07,
    kernelRadiusRange = 0,
    densityRange = 0,
    speed = 100L,
    speedRange = 0L,
    noiseLevel = 0.1,
    noiseInCluster = FALSE,
    eventFrequency = 30000L,
    eventMergeSplitOptions = FALSE,
    eventDeleteCreate = FALSE,
    modelSeed = NULL,
    instanceSeed = NULL
)
```

## Arguments

|                   |  |
|-------------------|--|
| k                 | The average number of centroids in the model.              |
| d                 | The dimensionality of the data.                            |
| numClusterRange   | Range for number of clusters.                              |
| kernelRadius      | The average radius of the micro-clusters.                  |
| kernelRadiusRange | Deviation of the number of centroids in the model.         |
| densityRange      | Density range.   |
| speed             | Kernels move a predefined distance of 0.01 every X points. |
| speedRange        | Speed/Velocity point offset.                               |
| noiseLevel        | Noise level.   |
| noiseInCluster    | Allow noise to be placed within a cluster.                 |
| eventFrequency    | Frequency of events.                                       |

|                        |                                |
|------------------------|--------------------------------|
| eventMergeSplitOptions | Merge and split?               |
| eventDeleteCreate      | Delete and create?             |
| modelSeed              | Random seed for the model.     |
| instanceSeed           | Random seed for the instances. |

### Details

There are an assortment of parameters available for the underlying MOA data structure, however, we have currently limited the available parameters to the arguments above. Currently the `modelSeed` and `instanceSeed` are set to default values every time a [DSD\\_MOA](#) is created, therefore the generated data will be the same. Because of this, it is important to set the seed manually when different data is needed.

The default behavior is to create a data stream with 3 clusters and concept drift. The locations of the clusters will change slightly, and they will merge with one another as time progresses.

### Value

An object of class `DSD_RandomRBFGeneratorEvent` (subclass of [DSD\\_MOA](#), `stream::DSD`).

### Author(s)

Michael Hahsler and John Forrest

### References

Albert Bifet, Geoff Holmes, Bernhard Pfahringer, Philipp Kranen, Hardy Kremer, Timm Jansen, Thomas Seidl. MOA: Massive Online Analysis, a Framework for Stream Classification and Clustering *Journal of Machine Learning Research (JMLR)*, 2010.

### See Also

Other `DSD_MOA`: [DSD\\_MOA\(\)](#)

### Examples

```
stream <- DSD_RandomRBFGeneratorEvents()
get_points(stream, 10)

if (interactive()) {
  animate_data(stream, n = 5000, horizon = 100, xlim = c(0, 1), ylim = c(0, 1))
}
```

---

DSRegressor\_MOA      *DSRegressor\_MOA – MOA-based Stream Regressors*

---

### Description

Interface for MOA-based stream regression methods based on package **RMOA**.

### Usage

```
DSRegressor_MOA(formula, RMOA_regressor)

## S3 method for class 'DSRegressor_MOA'
update(object, dsd, n = 1, verbose = FALSE, block = 1000L, ...)

## S3 method for class 'DSRegressor_MOA'
predict(object, newdata, type = "response", ...)
```

### Arguments

|                |  |
|----------------|--|
| formula        | a formula for the regression problem.                                    |
| RMOA_regressor | a RMOA_regressors object.  |
| object         | a DSC object.  |
| dsd            | a data stream object.  |
| n              | number of data points taken from the stream.                             |
| verbose        | logical; show progress?  |
| block          | process blocks of data to improve speed.                                 |
| ...            | further arguments.   |
| newdata        | dataframe with the new data.   |
| type           | prediction type (see <a href="#">RMOA::predict.MOA_trainedmodel()</a> ). |

### Details

DSRegressor\_MOA provides an interface to MOA-based stream regressors using package **RMOA**. Available regressors can be found at [RMOA::MOA\\_regressors](#).

Subsequent calls to `update()` update the current model.

### Value

An object of class `DSRegressor_MOA`

### Author(s)

Michael Hahsler

## Examples

```
## Not run:
library(streamMOA)
library(RMOA)

# create a data stream for the iris dataset
data <- iris[sample(nrow(iris)), ]
stream <- DSD_Memory(data)
stream

# define a stream regression model.
cl <- DSRegressor_MOA(
  Sepal.Length ~ Species + Sepal.Width + Petal.Length,
  RMOA::Perceptron()
)

cl

# update the model with 100 points from the stream
update(cl, stream, 100)

# look at the RMOA model object
cl$RMOAObj

# make predictions for the next 50 points
newdata <- get_points(stream, n = 50)
pr <- predict(cl, newdata)
pr

plot(pr, newdata$Sepal.Length, xlim = c(0,10), ylim = c(0,10))
abline(a = 0, b = 1, col = "red")

## End(Not run)
```
